ADVERTISEMENT.

THE Committee appointed by the Horticultural Society to direct the publication of the Papers read before them, take this opportunity to inform the Public, that the grounds of their choice are, and will continue to be, the importance and singularity of the subjects, or the advantageous manner of treating them, without pretending to answer for the certainty of the facts, or the propriety of the reasonings, contained in the several Papers so published ; which must still rest on the credit or judgment of their respective Authors.

It is likewise necessary, on this occasion, to remark, that it is an established rule of this Society, to which they will always adhere, never to give their opinion, as a body, upon any subject, either of Nature or Art, that comes before them. And, therefore, the thanks which are proposed from the Chair, to be given to the Authors of such Papers as are read at the General Meetings, or to the Persons who send fruits, or other vegetable productions, or exhibit Inventions of various kinds to the Society, are to be considered in no other light than as a matter of civility, in return for the respect shewn to the Society by these communications.

Mean Height of the Barometer in 1841.

Mean and Extremes of Temperature, and Mean of the Dew Point in 1841.

Monthly depth of Rain in 1841.

I. *Journal of Meteorological Observations made in the Garden of the Horticultural Society at Chiswick during the year 1841.*
By Mr. ROBERT THOMPSON.

This Journal has been kept on the same plan as the preceding.

	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	45	34	48	28	W	Little			<p>The mean temperature was about 2° below the average for this month. On the nights of the 7th and 8th the frost was intense, the thermometer falling to within 6° of zero. The barometer was considerably below the average; and the depth of rain was more than an inch above the usual quantity. A tremendous thunder storm occurred on the 3rd, about 7 A. M., accompanied at first with high wind, then hail and sleet; the flashes of lightning being unusually large and vivid. Much rain and snow fell between the 10th and 15th; a rapid thaw took place on the 16th, the water at the same time being prevented from sinking into the earth by the frozen crust, which was from 8 to 12 inches in depth, where the ground was bare; the consequences were great inundations throughout the country, with loss of life and property.</p> <p>Mean Pressure from the 3 daily observations 29.772 inches — Temperature Ditto 35°.19 — Dew Point Ditto 34.58 — Degree of Dryness ... Days.	Temperature.				Wind.		Rain.	Remarks.																
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	31	23	42	19	NE	Brisk		<p>The mean temperature was nearly 3° below the average. The barometer also averaged low, although only half the usual quantity of rain fell. The frost was not at any time remarkably intense; but up to the 10th it was continued, the thermometer being night and day below freezing. The frost had reached as much as 9 inches below the surface in kitchen garden soil; and this crust was completely thawed by the 15th. Although the frost had neither penetrated so far below the surface, nor was so intense above ground, as in the preceding month; yet, being accompanied by a brisk, and, for the period of the season, very drying East and North East winds, vegetation suffered much more.</p> <p>Mean Pressure from the 3 daily observations 29.768 inches. — Temperature Ditto 37°.22 — Dew Point Ditto 35°.72 — Degree of Dryness Ditto 1°.50 — Degree of Moisture .. MARCH.

Temperature.					Wind.		Rain.		Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	41	27	42	22	S	Little	.10		<p>This month was on the whole exceedingly fine for the period of the season. Vegetation was in a very dormant state at the commencement; for the three preceding months were of a severe character; but in the present the mean temperature was nearly 4° above the average, and by the end of the third week Peach and Nectarine trees on walls were in blossom, and the common Hawthorn partially in leaf. It was the warmest March since 1830. The thermometer was seldom below freezing and only once so low as 27°. The amount of rain was exactly the average quantity; still however the barometer was lower than usual. The wind was chiefly from the South and South West, and not so boisterous as is generally the case in this month.</p> <p>Mean Pressure from the 3 daily observations 29.895 inches. — Temperature Ditto 46°.89 — Dew Point Ditto 44°.42 — Degree of Dryness ... 1	52	41	61	36	W	Little	.05		<p>The mean pressure, temperature, and amount of rain were a fraction below the averages. Vegetation was brought much forward by the fine weather in March; but it progressed very slowly during the first three weeks of the present month, the temperature being low, generally, and often below freezing at night. In the last week, however, a fresh impulse was given to vegetation, in consequence of a rise of mean temperature to more than 5° above the average, with a plentiful supply of moisture. The 24th and 25th were boisterous; the 27th very sultry, with lightning at night.</p> <p>Mean Pressure from the 3 daily observations 29.839 inches. — Temperature Ditto 48°-90 — Dew Point Ditto 44°-32 — Degree of Dryness ... Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	76	42	96	38	E	Little		<p>This month was genial for vegetation throughout. The amount of rain was greater than usual by rather more than half an inch; but the temperature was also higher by 2°.7. Nor was the growth of vegetation hence induced unsubstantial like that produced by heat and a continually moist and sunless atmosphere; for notwithstanding the more than usual quantity of rain, there were but few days on which a great amount of dryness was not detected by the hygrometer. The 27th was hot and sultry; at $\frac{1}{4}$ past 8 P. M. sheet lightning, with some of the zig-zag kind, appeared almost continuous; thunder was heard between 10 and 11, and abrupt showers of rain fell in heavy drops.</p> <p>Mean Pressure from the 3 daily observataions 29.858 inches — Temperature Ditto..... 60°.06 — Dew Point Ditto..... 54°.59 — Degree of Dryness Ditto..... 5°.47 — Degree of Moisture ... Days.	Temperature.				Wind.		Rain.		Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	72	47	91	42	NE	Little			<p>In this month the supply of moisture was abundant ; but heat was deficient. The mean temperature, instead of progressing, fell 2° lower than that of the preceding month, and was 4½° below the average. Very little rain fell between the 6th and 16th, and cold notherly winds were then prevalent. The last half of the month was generally cloudy and wet. On the 23rd nearly half an inch of rain fell in less than an hour.</p> <p>Mean Pressure from the 3 daily observations 29.922 inches. — Temperature Ditto 58°.64 — Dew Point Ditto 53°.79 — Degree of Dryness ... JULY.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	63	59	66	59	SW	Little	.05	<p>The mean temperature advanced more than 4° in the month; but it was still 2° below the average. The amount of rain was upwards of an inch in excess. The quantity which fell on the 15th was remarkable, being very little short of an inch and a half and mostly as heavy thunder-showers. The morning was fine; but before noon the clouds, in dense dark masses, were observed to be in great commotion. The storm broke forth with great violence; and hail of large size fell to the westward. Towards night the rain set in heavy and constant, with more frequent but less violent occurrence of thunder and lightning.</p> <p>Mean Pressure from the 3 daily observations 29.819 inches. — TemperatureDitto..... 60°.98 — Dew PointDitto..... 57°.01 — Degree of DrynessDitto..... 3°.97 — Degree of Moisture....Ditto..... .872 — Force of Vapour.....Ditto..... .463 inch. Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.																	
1	66	49	72	43	SW	Little	.02		<p>The weather still continued moist; but in this month an average temperature was fully maintained, south and south-west winds being prevalent. The mean height of the barometer was nearly $\frac{1}{8}$ of an inch lower than usual. The temperature during the days was below the average in the first half of the month; but the minimum at nights averaged higher than it generally does at this period of the season, which is to be accounted for in consequence of the clouded state of the atmosphere. A great change however took place in the last week, the mornings being then foggy, and the days hot.</p> <p>Mean Pressure from the 3 daily observations 29.860 inches. — Temperature.....Ditto..... 62°.33 — Dew Point.....Ditto..... 59°.60 — Degree of Dryness....Ditto..... 2°.73 — Degree of Moisture...Ditto..... .910 — Force of Vapour.....Ditto..... .507 inch. Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	72	36	90	32	S	Little		<p>This month was warmer than usual and more moist. The mean temperature was upwards of 2° above the average; and the amount of rain was nearly an inch excess. The barometer was low throughout. During the first three weeks there were however intervals of dry weather, favourable for the process of ripening; but from the 21st to the end of the month there was not one wholly dry day. Upwards of 2½ inches of rain fell in the last 10 days. The 27th was stormy with heavy rain and much lightning at night. The 28th and 29th were boisterous.</p> <p>Mean Pressure from the 3 daily observations 29.725 inches. — Temperature Ditto 59°.26 — Dew Point Ditto 57°.53 — Degree of Dryness Ditto 1°.73 — Degree of Moisture .. OCTOBER.

Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	64	43	73	40	N	Little	.20	<p>This was an exceedingly wet month the amount of rain being upward of 4½ inches. There were only 4 days on which rain did not fall. The barometer was remarkably low on the 6th, 7th and 24th; and its average height was lower than in any month during the preceding 15 years at least. On the 18th the tide at Chiswick rose higher than it has done since the 28th December, 1821. The mean temperature was about a degree below the average. Frost at night occurred only twice; that on the 21st was such as to destroy the Dahlia flowers. The ground was so deluged as to be rendered totally unfit for being properly worked; and for most garden operations the weather was very unfavourable.</p> <p>Mean Pressure from the 3 daily observations 29.538 inches — Temperature Ditto 49°.98 — Dew Point Ditto 49°.55 — Degree of Dryness ... 1	52	45	60	44	W	Little	.10	<p>The weather was hazy up to the 10th, but with little rain. From this date to the end of the month there were only four dry days, the amount of rain being nearly an inch higher than usual. The mean temperature was about a degree above the average. Westerly winds were prevalent. The 16th was clear and cold with severe frost at night. The 14th and 18th were stormy with rain and sleet. Much rain fell on the 28th and 29th; the 30th was boisterous, the barometer at the same time falling very low. Many of the grounds adjoining the Thames were flooded to an unusual extent in consequence of the state of the weather on these days and the previously saturated condition of the earth.</p> <p>Mean Pressure from the 3 daily observations 29.746 inches — Temperature.....Ditto..... 43°.93 — Dew Point.....Ditto..... 43°.02 — Degree of Dryness.....Ditto..... 0°.91 — Degree of Moisture.....Ditto..... .966 — Force of Vapour.....Ditto..... .280 inch. II. *On the Oxalis Deppei, and its Cultivation as a culinary plant.*
 By Mr. ROBERT THOMPSON, Superintendent of the Orchard
 and Kitchen Garden Department in the Society's Garden.

Read December 5, 1843.

AN article on the *Oxalis Deppei*, by Professor MORREN of Liège, having appeared in "the Gardener's Chronicle," vol. I. p. 68., attention was directed to its cultivation in the Garden of the Society; the mode of culture recommended by Professor MORREN being adopted in the first instance. The results of this, and of other modes subsequently tried, leave no doubt respecting the facility with which this real accession to the list of culinary vegetables can be successfully cultivated, so as to furnish an abundant supply. It was necessary that this fact should be well ascertained, because another species of the same genus, *Oxalis crenata*, has not realized the expectations entertained respecting it.

Oxalis Deppei was first introduced into this country from Mexico in 1827; and was named by Messrs. LODDIGES in their *Botanical Cabinet*, No. 1500. Subsequently M. LEJEUNE gave it the name of *Oxalis zonata*, "in order to express the black bands of the leaf;" and M. HENON published some information concerning it in the year 1838.*

The uses of this *Oxalis* in Belgium are enumerated by Professor MORREN. He states "that if cut longitudinally the root is found to have a firm transparent rind, the tissue of which resembles that of Salep; like it, it becomes white in drying, is transparent, and consists of cells enclosing a very nutritious substance. The young leaves are dressed like sorrel, in soup or as a vegetable; they have

* Notice sur l'Oxalide de Deppe. 8vo. Lyons, 1838.

a fresh and agreeable acid, especially in spring. The flowers are excellent in salad, alone or mixed with corn salad, endive of both kinds, red cabbage, beet-root, and even with the petals of the Dahlia, which are delicious when thus employed. When served at table, the flowers with their pink corolla, green calyx, yellow stripes and little stamens produce a very pretty effect. The roots, after having been washed and slightly peeled, are gently boiled with salt and water. They are then eaten like asparagus in the Flemish fashion, with melted butter and the yolks of eggs. They are also served up like scorzonera and endive, with white sauce. They form, in whatever way they are dressed, a tender, succulent dish, easy to digest, and agreeing with the most delicate stomach. The analogy of the root with Salep indicates that its effects should be excellent upon all constitutions."

The plant consists of a tapering, white, semi-transparent tap-root of tender substance ; furnished, chiefly at and near the lower extremity, with hair-like fibres, a few of which also proceed from the sides. The centre is generally more or less hollow, with the medullary substance adhering in variously fissured portions. The roots in this case are not however in other respects unsound. Sometimes, from rapid absorption, clefts are formed externally ; but this will probably be of rare occurrence under favourable circumstances of soil and climate.

On the top of the crown, a mass of scaly bulbs appears ; their scales are lined and fringed with orange-brown silky hairs. By means of these buds the plants can be easily and abundantly multiplied. The leaf-stalks are from nine inches to a foot or more in length, supporting four inversely heart-shaped leaflets ; each having a dark-coloured band across its centre ; these bands are somewhat curved, so that when the four leaflets are arranged in a flat equidistant manner, a tolerably perfect dark circle is formed. The flowers are of a bright rose colour, and are supported on erect scapes above the leaves.

Roots and scaly bulbs of *Oxalis Deppei*, natural size.

Professor MORREN states that *Oxalis Deppei* "will not thrive in loam, still less in calcareous earth; that it always suffers in heavy land, and often will not produce its tap-roots; but in a sandy soil, light, and mixed with decayed vegetable matter, the plant acquires a large size. The aspect in which it is grown is immaterial, although a southern exposure is to be preferred when not dry." He plants the bulbs on the 15th of April, when he no longer fears frost, an inch deep and five inches apart, in rows which are seven inches asunder. Three or four are put into the same hole, taking care to arrange them in quincunx. The beds are kept clean and in the month of May are watered with liquid cow-dung. As has been already observed, the above mode was adopted in the Society's Garden; but it has been found that the plants do better when the bulbs are planted, singly, six inches apart, in rows a foot asunder.

The soil in the Society's Garden is not naturally well adapted for the growth of some tap-rooted vegetables; the carrot in particular may be instanced as never producing very fine roots in the usual way of cultivation. This being the case, holes are sometimes made and filled with prepared soil for this crop, in order to encourage the tap-roots to extend downwards without subdivision. A similar plan was tried with the *Oxalis*, and found to answer better than where the whole bed was composed of prepared soil; and the expense was of course comparatively little.*

The bulbs were planted about the middle of April, so shallow as to admit of their being just covered; for thus they occupy a position with regard to the surface similar to that in which they are produced, and this seems indispensable if fine sorts are to be obtained. They have been observed, indeed, to spring up from a considerable depth; but in this case tap-roots were not formed.

During summer the soil must be kept moist in dry weather;

* The plant from which the accompanying figure was made was grown by this method. It would have doubtless been even finer had the summer been more congenial.

otherwise, when rain falls abundantly, the sudden accession of water to the roots occasions their splitting. The plants should be allowed to grow as long as there is no danger from frost; but previously to this occurring, they should either be taken up or protected. If protected from frost, by frames, or otherwise, the roots will continue to increase in size till November. When taken up, the roots should be divested of the numerous bulbs formed on their crowns, and then stored up for use in a cool dry place, but secure from frost. A similar situation will be proper for the bulbs; or they may be kept in dry sand till the season of planting.

Mr. COCKBURN, Gardener to the Earl of MANSFIELD, at Caen Wood, Hampstead, grows this plant in perfection with no particular preparation of soil; merely planting the bulbs in shallow drills, a foot apart, in borders dug and manured as for other kitchen-garden crops. He also plants it by the sides of walks in the woods, as an ornamental plant.

We have in our gardens another *Oxalis*, apparently the *O. Jacquiana*, which also produces tap-roots like those of *O. Deppei*; but they are much smaller, and inferior in quality. That species is readily known by its flowers being very small and of a pale lilac colour.

III. *Experiments on the Inorganic Constituents of Plants.* By EDWARD SOLLY, Esq., F. R. S., F. L. S., Hon. Memb. Roy. Agr. Soc. Eng. Experimental Chemist to the Horticultural Society.

(Communicated by the Chemical Committee.*)

IN pursuing, under the direction of the Chemical Committee, my enquiries into the office performed by the inorganic constituents of Plants, several subjects of investigation naturally presented themselves; amongst which are the following questions. Are the quantity and nature of the inorganic matters which exist in plants certain and invariable, or do they fluctuate and vary according to circumstances? If variable, what are the causes which influence their absorption, and how may it be augmented or diminished? and thirdly, what connexion is there between the formation of any peculiar organic substance and the absorption of particular inorganic matters from the soil? Without pretending to attempt the solution of these questions, I shall proceed to describe briefly some of the experiments, which the consideration of them led to.

In order to trace, if possible, the connexion between the growth of plants and the absorption of particular substances, or their presence in the soil, several experiments were made on different plants, which were manured with various substances and subsequently examined, both mechanically, as to their size or increased development, and chemically, to ascertain what influence the manure had

* The CHEMICAL COMMITTEE of the Society is supported by voluntary subscriptions among the Fellows of the Society. The following are the present Members of the Committee and the amount of their Subscriptions: His Grace the Duke of Devonshire, 50*l.*; E. Barnard, Esq., 1*l.*; Major Buckley, 1*l.*; Jos. Blunt, Esq., 1*l.* 1*s.*; Thomas Farmer, Esq., 5*l.*; Dr. Henderson, 1*l.*; Sir C. Lemon, Bart., 5*l.*; Dr. Lindley, 5*l.*; Sir O. Mosley, Bart., 5*l.*; W. Murray, Esq., 2*l.*; W. Ogilby Esq., 1*l.*; E. W. Pendarves, Esq., 2*l.*; W. H. Pepys, Esq., 2*l.*; John Rogers, Esq., 5*l.*; R. Horsman Solly, Esq., 5*l.*; Sir J. Sebright, Bart., 5*l.*; Samuel Solly, Esq., 5*l.*; E. Strutt, Esq., 2*l.*; C. Webb, Esq., 3*l.*; J. Wedgwood, Esq., 1*l.*

on the absorption of inorganic, and the formation of organic, matter. The first results obtained were wholly negative, principally from the fact that too small a quantity of the various manures employed, was taken; great inconvenience was also experienced in consequence of the very unequal nature of the soil of the gardens, which led to irregular and unexpected results.

Before describing any experiments, it will be proper to say a few words respecting the nature of the soil on which they were made. The soil of the Horticultural Gardens varies a good deal both in mechanical texture, and in chemical composition. The greater part of it may be termed loamy; but its exact nature of course differs considerably according to the treatment it has received, the mode in which it has been worked, and the nature and quantity of manure which has been applied to it. Generally speaking, it is rich in organic matter, both animal and vegetable, and consequently like all soils of that description, contains a notable quantity of Salts of Ammonia. From its uncertain nature it is far more difficult to define its chemical composition, than is the case with ordinary land; the following are average results, and may be taken as expressing pretty nearly the composition of the soil of the Gardens. A fair sample, freed from stones and well dried, being subjected to mechanical analysis, was found to consist of

Small stones	640
Sand	3470
Finely divided earthy matter	5190
Fibrous organic matter	180
Finely divided and soluble organic matter	520—10000

The sand and small stones were chiefly of a siliceous nature; the chemical composition of the dry soil was

Silica	78730
Alumina	5182
Oxide of Iron	8250
Lime	640
Magnesia	107
Potash and Soda	47
Chlorine	4
Sulphuric Acid	7
Phosphoric Acid	18
Organic matters	7000—100000

In expressing these results, as well as in all the following analyses, I have carefully avoided the use of fractions of any kind; in all the experiments described, the numbers given are

those which would have been obtained, had 10000 or 100000 parts of each substance been analysed. The composition of a substance can be expressed as well by whole numbers, as by decimals; whilst the use of the latter frequently leads to confusion.

The first large experiment was on SAVOYS. A square of young savoys was taken, the plants in which were as nearly as possible uniform in size, and growing under the same circumstances. They were manured with various saline and inorganic substances, applied as top dressings; the quantity used increasing gradually from 100 to 2000 grains to each plant. The substances taken were, Nitrate of Potash, Alum, Nitrate of Soda, Muriate of Ammonia, Sulphur, Sulphate of Iron, Phosphate of Soda, and Sulphate of Magnesia; a number of plants being left without any manure, for the sake of comparison. The effects produced by these various substances, on the appearance of the plants were much less than had been anticipated; very slight differences could be observed and those differences which were apparent, were so irregular and uncertain, that it was hardly possible to say how much could fairly be attributed to the manures, and how much to local circumstances. A number of the plants were, however, examined chemically, but the result of their examination proved as irregular as the effect produced by the manures. The following table exhibits the proportion of water, organic matter, inorganic substances, and azotised matter which they contained.

Young white leaves or heart of Savoy; Composition of 10000 parts.

Manure used.	Water.	Organic matter.	Inorganic matter.	Inorg. matt. in 10000 parts dry.	Albumen in 10000 parts fresh.
Nitrate of Potash	9152	776	72	849	14
Alum	9360	571	69	1093	36
Ditto	9563	389	48	1119	13
Nitrate of Soda	9159	784	57	686	34
Muriate of Ammonia	9352	580	68	1057	26
Sulphur	9282	652	66	922	21
Ditto	9305	627	68	985	27
Ditto	9246	689	65	871	23
Sulphate of Iron	9307	630	63	913	16
Phosphate of Soda	9492	446	62	1247	13
Sulphate of Magnesia	9498	446	56	1121	16
No manure	9260	660	80	1006	24
Ditto	9066	860	74	789	44

Green or outer leaves of Savoy; as before.

Manure used.	Water.	Organic matter.	Inorganic matter.	Inorg. matt. in 10000 parts dry.	Albumen in 10000 parts fresh.
Nitrate of Potash .	8666	977	157	1392	48
Alum	8902	943	155	1430	51
Ditto	8625	1077	298	2174	24
Nitrate of Soda .	8995	868	137	1371	58
Muriate of Ammonia	9272	602	116	1600	31
Sulphur	9038	801	161	1674	52
Ditto	8679	1214	107	813	31
Ditto	8926	929	145	1356	24
Sulphate of Iron .	9137	742	121	1408	—
Ditto	8915	953	132	1223	35
Phosphate of Soda .	9012	840	148	1502	42
Sulphate of Magnesia	9094	723	183	2027	34
No manure	9101	745	154	1619	54
Ditto	9038	828	134	1394	64

It is evident that no definite conclusions can be drawn from this series of experiments. All the plants included in the foregoing tables were manured with 1800 or 2000 grains of the substance applied, but as these manures were merely spread on the surface of the soil, and were much protected from rain by the leaves of the young plants, a portion remained on the surface of the soil to the last; this in part accounts for the very trifling effect produced.

At the same time that these experiments were tried, some others were made with plants less able to bear large quantities of saline manures than savoys and most glaucous leaved plants are. A number of plants of common broad leaved **TOBACCO** were manured with Nitrate of Soda, the quantity employed increasing from 3 oz. up to 2 lbs., to each plant. Tobacco was selected for experiment because it is one of those plants which most commonly contain salts of Nitric acid; it was hence reasonable to expect that a top dressing of the Nitrate of Soda would produce a beneficial effect and also that a comparatively large quantity of that salt might be applied without fear of injury. Those plants which had received 4, 8, 12, and 16 oz. respectively of Nitrate of Soda were all rendered more vigorous in their growth and looked greener and far more flourishing than those not so manured; their luxuriance being nearly in proportion to the quantity of the salt they

had received : that to which 16 oz. had been applied being decidedly the best in the row. Beyond one pound no benefit appeared to be produced by increased doses of the Nitrate, and a plant which received 2 lbs. was evidently injured ; it soon began to look unhealthy ; the leaves became yellow and sickly, being covered with yellow and brown spots. The best plant, that which had received 1 lb. of the Nitrate, was then compared with another which had grown under precisely the same circumstances but had received no manure at all ; their relative composition was

	Water.	Organic matter.	Inorganic matter.	Inorganic in 10000 pts. dry.
Common Tobacco leaves	8440	1330	230	1474
Nitrated Tobacco leaves	8320	1420	260	1547

The proportion of azotised matter in the two plants was for each 10000 parts

	Fresh plant.	Dry plant.
Common Tobacco	134	858
Nitrated Tobacco	221	1315

In the examination of these plants a very remarkable fact was observed, which at first was supposed to be an error of observation, until it was confirmed by repetitions, and subsequent experiments. The plants of Tobacco which had received no manure contained a considerable quantity of Nitric acid ; those which had been manured with Nitrate of Soda, however, contained no appreciable quantity.

A corresponding experiment was made with LETTUCES, another plant commonly found to contain Nitrates ; but the results obtained in this case were less marked, because the plants had all been previously manured with rotten dung in the usual manner. Some of the plants were manured with the Nitrate, and others with the Carbonate of Soda ; the latter were very nearly as healthy in appearance, as those which had merely received dung ; in fact there was very little visible effect produced by either salt. On examination they were found to contain

	Water.	Organic matter.	Inorganic matter.	Inorganic in 10000 pts. dry.
Rotten Dung alone	9350	562	88	1357
Ditto and Nitrate of Soda	9387	535	78	1288
Ditto and Carbonate of Soda	9375	544	81	1292

Carbonate of Soda was employed, in order to compare the effect

produced by the Nitrate of Soda on the formation of azotised matter with that produced by the use of another salt of the same alkali, not containing nitrogen. The following was the result.

	Albumen fresh plant.	Albumen dry plant.
Rotten Dung	43	661
Ditto and Nitrate of Soda	46	750
Ditto and Carbonate of Soda	44	704

In the experiment with Tobacco just described, a considerable effect was produced by the Nitrate of Soda; a given quantity of leaves contained less water, and more organic and inorganic matter, than those which had not been manured with the nitrate; and it is evident that the nitrated plant had absorbed a larger quantity of inorganic matter, in proportion to its weight, than the other had, because on comparison it appears that the dry leaves of the former contained about a twentieth part more inorganic matter than the latter. In the case of the lettuces a very different effect was produced. In this, the plants manured with Carbonate and Nitrate of Soda, grew more rapidly than those manured with Rotten Dung alone; hence, they contained a larger proportion of water, and a smaller quantity of inorganic matter. This more vigorous growth was apparently not connected with any increased absorption of inorganic substances, because in both cases where the saline manure was applied, the dry plant contained nearly a twentieth less inorganic matter than that only manured with Dung.

A fourth experiment was made on a far more extended scale, with POTATOES. A number of tubers of the Bread-fruit potato were planted, each in the centre of a square yard of ground, and manured with various saline and other manures. The tubers taken, were as nearly as possible alike; they were planted on the 28th of April, the various manures being applied at the time the tubers were set. The stems or haulm were gathered, and the tubers taken up in October. The tubers were planted eight inches below the surface of the ground, each being placed in the centre of a square yard, the surface soil of which was removed to the depth of two inches; the manures were then spread, and the two inches of

soil replaced; the plants were subsequently earthed up in the ordinary manner. The nature of the manures applied, the quantity of produce obtained from each plant, and the composition of the tubers, &c. are as follows:—

No. 1. Not manured at all, the produce was, large tubers 7 lbs. 3 oz., small tubers 13 oz., total 8 lbs. The dry straw or haulm weighed 3270 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7713	2173	114	Starch	1071
Dry Tubers	—	9499	501	Starchy fibre	652
Dry Haulm	—	8872	1128	Albumen	87
				Mucilage, Resin, Fatty matter, &c.	504
				Water	7713—10000

No. 2. Manured with Rotten Dung at the rate of five tons per acre. The produce was, large tubers 11 lbs. 2 oz., small tubers 6 oz., total 11 lbs. 8 oz. The dry haulm weighed 2158 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7708	2170	122	Starch	1071
Dry Tubers	—	9368	532	Starchy fibre	572
Dry Haulm	—	8981	1019	Albumen	102
				Mucilage, Resin, Fatty matter, &c.	547
				Water	7708—10000

No. 3. Manured with Gypsum, at the rate of 2 cwt. 96 lbs. per acre. The produce was, large tubers 8 lbs., small tubers 4 oz., total 8 lbs. 4 oz. The dry haulm weighed 1013 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7722	2159	119	Starch	1079
Dry Tubers	—	9458	542	Starchy fibre	543
Dry Haulm	—	8609	1391	Albumen	112
				Mucilage, Resin, Fatty matter, &c.	544
				Water	7722—10000

No 4. Manured with Nitrate of Soda at the rate of 1 cwt. 48 lbs. per acre. The produce was, large tubers 8 lbs. 11 oz., small tubers 5 oz., total 9 lbs. The dry haulm weighed 1869 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7732	2158	110	Starch	1212
Dry Tubers	—	9512	488	Starchy fibre	613
Dry Haulm	—	8769	1241	Albumen	115
				Mucilage, Resin, Fatty matter, &c.	328
				Water	7723—10000

No. 5. Manured with Salt Cake (Sulphate of Soda) at the rate

of 1 cwt. 48 lbs. per acre. The produce was, large tubers 13 lbs. 14 oz., small tubers 1 lb. 2 oz., total 15 lbs. The dry haulm weighed 3301 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7734	2154	112	Starch	1215
Dry Tubers	—	9505	495	Starchy fibre	557
Dry Haulm	—	8970	1030	Albumen	97
				Mucilage, Resin, Fatty matter, &c.	397
				Water	7734—10000

No. 6. Manured with Epsom Salts (Sulphate of Magnesia) at the rate of 1 cwt. 48 lbs. per acre. The produce was, large tubers 9 lbs. 15 oz., small tubers 8 oz., total 10 lbs. 7 oz. The dry haulm weighed 2099 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7877	2001	122	Starch	1292
Dry Tubers	—	9425	575	Starchy fibre	589
Dry Haulm	—	8924	1076	Albumen	104
				Mucilage, Resin, Fatty matter, &c.	129
				Water	7877—10000

No. 7. Manured with Nitrate of Soda at the rate of 2 cwt 96 lbs. per acre. The produce was, large tubers 6 lbs. 12 oz., small tubers 13 oz., total 7 lbs. 9 oz. The dry haulm weighed 1652 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7720	2149	131	Starch	1232
Dry Tubers	—	9425	575	Starchy fibre	591
Dry Haulm	—	8935	1065	Albumen	119
				Mucilage, Resin, Fatty matter, &c.	338
				Water	7720—10000

No. 8. Manured with Salt Cake at the rate of 2 cwt. 96 lbs. per acre. The produce was, large tubers 17 lbs. 1 oz., small tubers none, total 17 lbs. 1 oz. The dry haulm weighed 2196 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7770	2123	107	Starch	1330
Dry Tubers	—	9519	481	Starchy fibre	495
Dry Haulm	—	8835	1165	Albumen	84
				Mucilage, Resin, Fatty matter, &c.	321
				Water	7770—10000

No. 9. Manured with Epsom Salts at the rate of 2 cwt. 96 lbs. per acre. The produce was, large tubers 9 lbs. 5 oz., small tubers 7 oz., total 9 lbs. 12 oz. The dry haulm weighed 2006 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7691	2191	118	Starch	1218
Dry Tubers	—	9485	515	Starchy fibre	652
Dry Haulm	—	8894	1106	Albumen	109
				Mucilage, Resin, Fatty matter, &c.	330
				Water	7691—10000

No. 10. Manured with Sal Ammoniac (Muriate of Ammonia) at the rate of 1 cwt. 48 lbs. per acre. The produce was, large tubers 10 lbs. 13 oz., small tubers 8 oz., total 11 lbs. 5 oz. The dry haulm weighed 2619 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7970	1915	115	Starch	1171
Dry Tubers	—	9430	570	Starchy fibre	642
Dry Haulm	—	8970	1030	Albumen	100
				Mucilage, Resin, Fatty matter, &c.	117
				Water	7970—10000

No. 11. Manured with Green Vitriol (Sulphate of Iron) at the rate of 1 cwt. 48 lbs. per acre. The produce was, large tubers 7 lbs., small 13 oz., total 7 lbs. 13 oz. The dry haulm weighed 1367 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7862	2025	113	Starch	1076
Dry Tubers	—	9468	532	Starchy fibre	684
Dry Haulm	—	8881	1119	Albumen	111
				Mucilage, Resin, Fatty matter, &c.	267
				Water	7862—10000

No. 12. Manured with a mixture of Nitrate of Soda and Salt Cake, containing equal parts of both, at the rate of 1 cwt. 48 lbs. The produce was, large tubers 9 lbs. 7 oz., small tubers 6 oz., total 9 lbs. 13 oz. The dry haulm weighed 2073 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7745	2138	117	Starch	1125
Dry Tubers	—	9480	520	Starchy fibre	591
Dry Haulm	—	8957	1043	Albumen	90
				Mucilage, Resin, Fatty matter, &c.	749
				Water	7445—10000

No. 13. Manured with Nitrate of Soda and Salt Cake, mixed in equal quantities, at the rate of 2 cwt. 96 lbs. per acre. The produce was, large tubers 8 lbs. 14 oz., small tubers 5 oz., total 9 lbs. 3 oz. The dry haulm weighed 1675 grains. The tubers and haulm contained

Tubers and Haulm.				Tubers.	
	Water.	Organic Matter.	Inorganic matter.		
Fresh Tubers	7856	2023	121	Starch	1067

Dry Haulm	—	8854	1146	Albumen	117
				Mucilage, Resin, Fatty matter, &c.	388
				Water	7745—10000

No. 27. Manured with Gas Water fixed with Sulphuric Acid, at the rate of 800 gallons per acre. The produce was, large tubers 8 lbs. 12 oz., small tubers 11 oz., total, 9 lbs. 7 oz. The dry haulm weighed 2029 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7860	2029	111	Starch	1150
Dry Tubers	—	9480	520	Starchy fibre	596
Dry Haulm	—	8842	1158	Albumen	97
				Mucilage, Resin, Fatty matter, &c.	297
				Water	7860—10000

No. 28. Manured with Gas Water fixed with Phosphoric Acid, at the rate of 800 gallons per acre. The produce was, large tubers 4 lbs. 13 oz., small tubers 8 oz., total, 5 lbs. 5 oz. The dry haulm weighed 965 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7858	2031	111	Starch	1172
Dry Tubers	—	9480	520	Starchy fibre	617
Dry Haulm	—	8664	1336	Albumen	127
				Mucilage, Resin, Fatty matter, &c.	226
				Water	7858—10000

No. 29. Manured with Gas Water fixed with Muriatic Acid, at the rate of 800 gallons per acre. The produce was, large tubers 8 lbs. 5 oz., small tubers 2 oz., total 8 lbs. 7 oz. The dry haulm weighed 1636 grains. The tubers and haulm contained

Tubers and Haulm.			Tubers.		
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7793	2093	114	Starch	1107
Dry Tubers	—	9480	520	Starchy fibre	620
Dry Haulm	—	8943	1057	Albumen	103
				Mucilage, Resin, Fatty matter, &c.	377
				Water	7793—10000

No. 30. Manured with Ammoniacal Gas Water fixed with Nitric Acid, at the rate of 800 gallons per acre. The produce was, large tubers 5 lbs. 6 oz., small tubers 12 oz., total 6 lbs. 2 oz. The dry haulm weighed 1332 grains. The tubers and haulm contained

	Tubers and Haulm.			Tubers.	
	Water.	Organic matter.	Inorganic matter.		
Fresh Tubers	7725	2154	121	Starch	1152
Dry Tubers	—	9465	535	Starchy fibre	685
Dry Haulm	—	8799	1201	Albumen	105
				Mucilage, Resin, Fatty matter, &c.	333
				Water	7725—10000

On comparing together the result of this series of Experiments, it is evident that there are several discrepancies, which are probably occasioned by local peculiarities in the plants which formed the subject of experiment; and that the trial was conducted on too small a scale. The analyses have therefore not been carried out to that degree of nicety which had been originally intended, as it was determined to repeat the experiment on a larger scale, and with a smaller number of simple saline manures. Several points, however, of considerable interest, are learnt, even by this experiment, as to the relation which exists between the weight of the stems, the proportion of earthy matter which they contain, the weight of the tubers, and the proportions of their azotised and inorganic constituents. In the following Table some of these results are exhibited, plants being arranged in the order of the weight of the stems.

Manure applied.	Weight of Haulm in Grains.	Inorganic matter in 10000 pts., Haulm.	Weight of Tubers, Ounces.	Inorganic matter in 10000 pts., Tubers.	Albumen in 10000 pts., Tubers.

15. Putrid urine and Sulphate of iron	1995	974	165	455	85
9. Epsom salts (2.96)	2006	1106	156	515	109
27. Gas liquor and Sulphuric acid	2029	1158	151	520	97
22. Nightsoil with Bleaching powder and Sulphuric acid	2029	980	158	500	97
12. Nitrate of soda and salt cake (1.48)	2073	1043	157	520	90
19. Bone dust	2084	1113	186	490	92
6. Epsom salts (1.48)	2099	1076	167	575	104
2. Rotten dung	2158	1019	184	532	102
5. Salt cake (1.48)	2196	1165	273	481	84
20. Nightsoil	2456	1050	179	530	99
25. Sulphur	2510	1203	145	450	95
17. Daniell's manure (new sort)	2515	970	185	505	107
10. Sal-ammoniac	2619	1030	181	570	100
16. Daniell's manure (old sort)	2619	1088	175	420	97
1. No manure	3270	1128	128	501	87
8. Salt cake (2.96)	3301	1030	240	495	97

* These numbers indicate the quantity of the manure used, either 1 cwt. and 48 lbs., or double that quantity, viz. 2 cwt. and 96 lbs. per acre.

It must be borne in mind that these experiments were made on garden ground, the composition and nature of which is very variable and uncertain, and far too rich to enable positive deductions to be formed of the relative value of the different substances employed as manure. The general inference furnished by the above table is, that those plants having the largest and most vigorous tops, produced the largest quantity of tubers; but that the tubers of these plants were the poorest in azotised matters. It is also worthy of remark, that those tubers which are richest in azotised matters, are also those which contain the greatest relative proportion of inorganic matter. Thus selecting from the foregoing table the three tubers richest, and the three poorest in azotised matter, we have

Richest.			Poorest.

Mean. 121	546	1331	85	478	2487

The earthy ingredients of the haulm and tubers, were for the reason above adverted to, not examined in detail; but a general analysis of the whole series was made, the results of which sufficiently show, that the nature of the earthy ingredients both of the haulm and of the tubers, but more particularly of the former, varied very greatly. The following tables exhibit the proximate composition of these inorganic matters, divided into Alkaline salts, earthy salts, and siliceous matter: the first head including Carbonate, Phosphate, Sulphate, and Muriate of Potash and Soda; the second, soluble as well as insoluble Salts of Lime and Magnesia, together with Oxides of Iron and Manganese. Both tables are arranged in the order of the quantity of Alkaline matter which the substances contained.

Inorganic Constituents of Experimental Potato Haulm.

	Alkaline.	Earthy.	Siliceous.

14. Putrid urine	8309	1640	51
6. Epsom salts (1.48)	8219	1682	99
16. Daniell's manure (old sort)	8211	1691	98
17. Daniell's manure (new sort)	8063	1803	134
29. Gas liquor and Muriatic Acid	8037	1907	56
15. Putrid urine and Sulphate of Iron	7293	2559	148

It is almost impossible to draw certain conclusions from these results, in consequence of the small scale on which the experiment was made, it is however worthy of remark that generally speaking, those stems which contained the greatest quantity of inorganic matter, contained relatively a larger proportion of alkaline salts, than those stems in which a less quantity of inorganic matter was found.

Particular attention was paid, during the examination of these plants, to the existence of Nitric Acid in them; none of the tubers were found to contain any; some of the stems did, whilst the greater number did not contain any Nitric Acid, the following table shews these differences:—

Stems which contained Nitric Acid.		Stems which contained no Nitric Acid.	
1.	Manured with nothing.	3.	Manured with Gypsum.
2.	do. Rotten Dung.	8.	do. Salt Cake. (2. 96.)
4.	do. Nitrate of Soda. (1. 48.)	9.	do. Epsom Salts. (2. 96.)
5.	do. Salt Cake. (1. 48.)	11.	do. Sulphate of Iron.
6.	do. Epsom Salts. (1. 48.)	13.	do. Nitrate of Soda and Salt Cake. (2. 96.)
7.	do. Nitrate of Soda. (2. 96.)	15.	do. Putrid Urine and Sulphate of Iron.
10.	do. Sal Ammoniac.	16.	do. Daniell's Manure (old sort).
12.	do. Nitrate of Soda and Salt Cake. (1. 48.)	17.	do. Daniell's Manure (new sort).
14.	do. Putrid Urine.	18.	do. Guano.
27.	do. Gas Liquor and Sulphuric Acid.	19.	do. Bone Dust.
29.	do. Gas Liquor and Muriatic Acid.	20.	do. Night Soil.
30.	do. Gas Liquor and Nitric Acid.	21.	do. Night Soil and Bleaching Powder.
		22.	do. Night Soil with Bleaching Powder and Sulphuric Acid.
		23.	do. Night Soil with Bleaching Powder and Sulphate of Iron.
		24.	do. Night Soil with Sulphuric Acid.
		25.	do. Sulphur.
		26.	do. Gas Liquor.
		28.	do. Gas Liquor and Phosphoric Acid.

The fact that some of these plants contained salts of Nitric Acid, whilst others did not, is very remarkable, and of especial interest in connexion with the action of the Nitrates as manure. Professor Liebig says, in his "Chemistry in its applications to Agriculture," etc. (3rd edit. p. 233.) "The presence of a Nitrate in plants permits only one conclusion — that the nitrogen of Nitric Acid is not employed in their organism for the formation of compounds containing that element, because, if it were, at a certain period of the life of the plant, it would disappear on account of this conversion." The existence of Nitrates in a plant cannot, as it appears to me, be

considered as any evidence that the Nitrate does not supply Nitrogen to the plant. It might in the same way be argued, that Ammonia does not supply nitrogen to plants, because it is very constantly found in them. With regard to the disappearance of the Nitric Acid at a certain period of the life of the plant, it is desirable to have experimental evidence; I have found in several cases that the proportion of Nitric Acid in plants was great when they were young and gradually diminished as they grew older. I have already adverted to the curious fact that when plants were manured with Nitrates they grew very vigorously, but were not found on examination to contain any Nitric Acid; in the experiments on potatoes just described, it appears, that those manured with Salt Cake and Nitrate of Soda (No. 13), contained no Nitric acid, whilst those manured with Salt Cake alone (No. 5), did contain Nitrates. In the course of an extensive series of experiments on plants, presently to be described, Nitric acid was found in the following:—

Potato — tubers, stems, leaves.	Clary, <i>Salvia Sclarea</i> — stalks.
Yellow Stem Beet — leaves, stems and roots.	Green Sage — leaves.
Bassano Beet — root.	Chenopodium Bonus Henricus or English Mercury — stalks.
Whyte's Dark Red Beet — root.	Chaumontel Pear — young and small unripe fruit.
Chappel's Brocoli — stems.	Marjoram — whole plant.
Victoria Brocoli — stems.	Spear Mint — leaves and stalks.
Spinach, Flanders, Lettuce-leaved and Summer — leaves and stalks.	Borage — leaves and stalks.
Fennel — leaves.	Lettuce — whole plant.
Mustard — whole plants.	Carrots — whole plants.
Shallots — bulbs.	Solomon's Seal — roots.
Tobacco — whole plants.	Mangel Wurzel — roots, leaves and leaf-stalks.
Rhubarb, <i>Rheum crispum</i> — bud scales.	Savory, Summer — whole plants.
Chervil, <i>Scandix odorata</i> — leaf-stalks.	Scarlet Runners — unripe pods.
Turnips — roots and leaves.	Brussels Sprouts — whole plants.
Radishes — roots and leaves.	Tomato — leaves and stems.
Cucumber — fruit.	

As considerable facilities are afforded for experiments on the absorption of earthy matters, by PARASITICAL plants and Epiphytes several experiments were made with these curious plants. Setting out with the known fact, that all plants contain certain inorganic matters, it became interesting to enquire whence those plants which grow on or derive their nourishment from other plants, obtain their earthy matters. It follows, that if parasites derive the earthy matters necessary to their growth, from the plants on which

they feed, that the growth of the former, must, to some extent, be dependent on the quantity of inorganic matter contained by the latter. This conclusion, if born out by experiment, would lead to a subject of considerable practical interest, namely, the influence which the earthy matters in wood may have on the growth of fungi, and decay of timber.

The Mistletoe (*Viscum album*) derives a large proportion of earthy matters from the trees on which it grows. On examining a plant, I found in the leaves 820, in the branches 462, and on the stem 282 parts of inorganic matter; whilst the apple tree on which it grew contained only 233 parts, in 10000 parts of the dry plants. On examining other parasitic plants and fungi, it was found that in all cases they contained a large proportion of earthy matters, and very commonly far more than the plants on which they grew. Whether the whole of these inorganic substances was derived from the trees on which they grew is questionable, it is by no means impossible that some of it may have been derived from the air. Several fungi contain it is well known a notable quantity of copper, I have in particular found it in the large brown *Boletus* which grows upon Elm Trees, but I was unable to detect any in the wood or bark of the tree on which it grew.

The inorganic constituents of EPIPHYTES were next examined. As many of these curious plants, which grow on the stems and branches of trees, derive nourishment chiefly from the air, and seem to flourish equally well, whether their roots enter the soil, or hang freely in the air; it was interesting to ascertain what proportion of earthy matters they contained, and whether it varied under different circumstances. It appeared probable that the quantity of inorganic matter which they contained would be smaller, than that in most plants, and that the quantity present in those which grew only in air would be less than in those whose roots entered the soil. It was found however that the leaves of Orchidaceous plants contain

about as much inorganic matter as those of cabbages and other similar plants and that there was but a trifling difference evident, whether the plants had their roots in the soil, or in the air. The proportion of earthy matter in a plant of *Catasetum* grown in soil and a plant of *Bletia*, grown wholly suspended in the air, were

	Water.	Organic matter.	Inorganic matter.	Inorganic in 10000 parts dry.
<i>Catasetum</i> bulbs	8669	1269	62	465
<i>Bletia</i> bulbs	8309	1609	82	488
<i>Catasetum</i> leaves	8055	1791	154	794
<i>Bletia</i> leaves	8200	1658	142	793

Though the whole quantity of earthy matter present in the plant, as shewn by the proportion contained in the dry leaves and bulbs was nearly similar, very considerable difference was found in the nature of these substances ; a proximate analysis gave

	<i>Catasetum</i> bulbs.	<i>Bletia</i> bulbs.
Alkaline Salts	3752	3792
Earthy Phosphates	183	222
Carbonate of Lime	4281	2850
Carbonate of Magnesia	1315	579
Siliceous matter	428	2596
	<hr/> 10000	<hr/> 10000

The examination of good and bad **TIMBER**, with a view to trace out any connection between its qualities and the inorganic substances it contains, is a subject requiring many experiments, and necessarily occupying a very long time. The following experiments, however, are complete in themselves, and possess considerable interest in connection with the present subject. In following out the general scheme of inquiry, a large collection of samples of wood from different localities, grown in various situations, and under various conditions has been made ; amongst these, was a series of specimens of oak wood, for which I am indebted to Sir William Symonds, and which, in addition to their being from different parts of the world, were all of known quality, each sample being marked with a note of its quality deduced from actual experience. It is to be regretted that the majority of them were bad or inferior, even those from localities whence the very best wood is usually imported, hence, of course, they cannot be regarded as

average samples but rather as exceptions. The proportion of earthy matter which they contained, together with their locality, and relative goodness, is contained in the following Table.

Oak Wood from	Quality.	Organic matter.	Water.	Inorganic matter.	Inorganic in 10000 parts dry.
America (white)	bad	9188	773	39	42
Ditto (live oak)	good	9306	621	73	78
Ditto ditto "Gibraltar"	good	8615	1111	274	308
Crimea	tolerable	8909	1026	65	73
Canada	bad	8845	1132	23	27
Circassian	indifferent	9125	841	34	37
Danzig	tolerable for plank	8939	1037	24	27
England (mean of 10.)	various	8888	1097	15	18
East Prussia	indifferent	9143	832	25	28
French	bad	8892	1092	16	19
Farnia (Tuscany)	bad	9234	722	44	52
Hainault	bad	8728	1258	14	16
Istria	bad	9011	923	66	73
Poland	indifferent	9059	924	17	18
Podolia	bad	8950	1019	31	35
Russia	bad	9013	977	10	11
Styria	indifferent and light	8985	997	18	20
Sardinia	good	8969	1003	28	32
Tuscany	good	8899	917	184	202
Ischia	good for plank	9025	957	18	20

The larger proportion of earthy matters in the oak of southern countries is remarkable, as contrasted with the smaller quantity found in English oak, and the oak of northern countries generally. Still from this table no general conclusion can be drawn as to the relation between the inorganic substances and the quality of the wood.

To the kindness of Sir W. Symonds, I am also indebted for samples of English oak and Danzig fir in the first stages of dry rot. In both of these, the proportion of inorganic matter is very large; the result of the examination of these samples, together with that of two good samples of sound Memel and Danzig fir, is given in the following Table.

	Organic matter.	Water.	Inorganic matter.	Inorganic in 10000 parts dry.
Oak Timber beginning to decay	6738	3230	32	47
Oak Plank ditto ditto	7273	2682	35	49
Fir Timber ditto ditto	6046	3756	198	318
Fir Timber, Memel, sound	8778	1201	21	24
Fir Timber, Danzig, sound	9084	899	17	19

Generally speaking the young parts of plants contain far more INORGANIC MATTER than the older parts; after a certain time, and particularly when woody fibre is formed, the organic part of the

plant continues to increase far more rapidly than the inorganic matters do: hence the real proportion of the latter appears to decrease. In the experiment however, on Savoys, first described, it would seem that the young leaves contained in reality less earthy matter, than the older leaves; and that in them the proportion of inorganic to organic matter, was smaller than in the older leaves. On comparison it was found that a very marked difference existed in the composition of these inorganic matters; a proximate analysis gave

	Young leaves.	Old leaves.
Alkaline salts	5191	3497
Earthy Phosphates and Oxide of Iron	3446	1986
Carbonate of Lime	712	2665
Carbonate of Magnesia	151	815
Siliceous matter	500 in 10000.	1037 in 10000.

The young leaves of the Savoy are so completely protected from air and light that they can hardly be well compared with the young leaves of ordinary plants, which as soon as they emerge from the bud are to a greater or less degree exposed to the light. In order to ascertain what influence LIGHT has on the absorption of inorganic matters, a number of hyacinths were grown, some in light and some in darkness; the following were the results. The bulbs selected were as nearly as possible similar in size and weight; half were planted in dark and half in light, some in water only, others in rich artificial soil, and the rest in sand. Four of the roots being dried thoroughly and burnt, their composition was found to be very nearly uniform; they consisted of 6435 water, 3442 organic matter, and 123 parts of inorganic matter. After growing and flowering the plants were examined; in some instances those grown in the dark contained the greatest proportion of inorganic matters, whilst in other cases they were found to contain less, than those grown in light. The average of the whole series was

	Organic matter.	Inorganic matter.
Plants grown in water; light	9231	769
dark	9252	748
Plants grown in sand; light	8837	1163
dark	8872	1128
Plants grown in soil; light	8948	1052
dark	8885	1115

The differences in the quantity of inorganic matter between those grown in light, and those grown in darkness, were comparatively small; it is evident however that there was no great deficiency of inorganic matter in the plants which grew in the dark; and this was the result arrived at from numerous experiments on other plants. In many cases it was found that the plants which grew in the dark, contained the greatest quantity of inorganic matter; but this was not always the case; and the general conclusion appeared to be that light does not exert any decided influence on the absorption of these substances. In the experiment on Hyacinths just described, some remarkable effects were observed, which though not altogether new, are worthy of record. The plants which grew in the dark were much the largest and much the most succulent, the leaves and stems were perfectly white, but the flowers were in all cases quite as brilliant in colour as those which grew in light; they were however nearly devoid of scent. The colour of those which grew in the dark appeared to be more permanent than the others, for, on drying, they retained their colour perfectly; whilst those which grew in light, faded, and soon became dingy.

A number of experiments were also made to determine what influence the SALTS OF AMMONIA HAD ON THE ABSORPTION OF EARTHY MATTERS, and their result was more definite; it appeared that salts of Ammonia almost always caused an increased absorption of inorganic substances, and more especially influenced the absorption of Potash from the soil, and the formation of Nitre. It had been anticipated from previous experiments, that salts of Ammonia would, by causing plants to grow more vigorously, enable them to take more potash &c. from the soil, so that the whole quantity of inorganic matter which each plant contained, would be increased, but that the relation which existed between it, and the organic matter would be unaltered. The result of a number of

experiments however shewed, that the proportion of inorganic to organic matter, was increased in a greater proportion by salts of Ammonia than by salts of the fixed Alkalies. The following are a few examples of their effects.

Perfectly similar plants of broad leaved summer Spinach were manured, some with Sulphate of Ammonia, and others with Nitrate of Potash; the salts being applied in tolerably large quantity, as a top dressing. Both manures produced a remarkable effect, increasing the size of the leaves very greatly, and causing the plants to grow with the utmost vigour. On examination they were found to consist of

		Water.	Organic matter.	Inorganic matter.	Inorganic matter in 10000 pts. dry.
Manured with Sulphate of Ammonia	leaves	9229	589	182	2370
Do. do. do.	stems	9601	288	111	2791
Manured with Nitrate of Potash	leaves	9098	717	185	2057
Do. do. do.	stems	9586	310	104	2516

By the last column it appears, that a considerably larger quantity of inorganic matter was taken up, by the plants manured with sulphate of Ammonia, than by those treated with Nitrate of Potash; the former also were the most succulent, but in size and appearance when growing, there was no perceptible difference.

A similar experiment was made with Shallots. The colour of the plants was much darkened, and their size was increased, but not to the same extent as with the Spinach. The Shallots contained

Manured with Sulphate of Ammonia	8686	1221	93	717
Manured with Nitrate of Soda	8455	1450	95	619

A third experiment on Tobacco also gave a similar result; in this case Phosphate of Ammonia was compared with Nitrate of Potash. The plants were examined after flowering, and were much older than those described in a previous experiment, (p. 39.) The composition of the leaves and stalks was

		Water.	Organic matter.	Inorganic matter.	Inorganic matter in 10000 pts. dry.

In order to facilitate subsequent experiments, and to supply data for any calculations, which might be required, it appears desirable to ascertain by careful experiments, the EXACT QUANTITY OF INORGANIC matter taken up from the soil by the more ordinary plants when growing in full vigour. Accordingly, a series of the most important vegetables, herbs, and fruits, in the Gardens of the Society, has been submitted to this kind of investigation, and a portion of the results is embodied in the following Table; which shews the proportion of water, organic and inorganic matter contained in the various plants examined, together with the proportion which the inorganic bore to the organic part of the dry plant. The plants were all carefully selected, none but clean healthy specimens being taken; they were dried in a stove at a temperature of about 200° Fahr.; and were considered dry when several hours exposure to that temperature occasioned no further reduction in weight. The dry plants were burnt to coal on porcelain, or polished iron plates heated by gas lamps, and the coals incinerated at the lowest possible temperature in platinum basins.

In order to carry out more fully the objects contemplated in the experiments on Savoys and Potatoes already described, a series of experiments were made the succeeding year, on a much larger scale, but with a more limited number of manures. Four plants were selected for the purpose, namely Wheat, Potatoes, Peas and Mangel Wurzel. These experiments are now so far concluded, that the practical effects produced by the different manures, are known; the variations in the chemical composition of the crops, obtained by the manures, is at present being investigated. All the experiments made at the gardens, were under the care of Mr. Robert Thompson. The following is a description of the mode in which the experiments were conducted, the manures employed, and the produce obtained; the chemical enquiries which these experiments give

rise to, and the conclusions which may be drawn from them, will form the subject of a future communication.

A piece of ground divided into twenty-four beds, was sown with Talavera Spring WHEAT, drilled in rows, six inches apart on the 21st of March. The ground was tolerably uniform and had not received any manure for some years, having previously been used for the cultivation of garden annuals. It was however in good condition; in fact as the results of the experiments shewed, in rather too good condition for the purpose. On the 19th of April, the plants being fairly up, and from two to four inches in height, the manures were applied, being sown broadcast across the drills. Twenty-two of the squares were manured, two and two, with eleven different substances, whilst the remaining two were left without any manure. On the 1st of June, the plants being then about a foot and a half high, twelve of the squares, eleven of them having different saline manures, and the twelfth being one of those left without any manure, received in addition an equal quantity of silicate of Potash; thus the first square had a saline manure alone, the next had the same saline manure and in addition a quantity of silicate of Potash; the next had a second saline manure, the fourth had the same saline manure, with the addition of silicate of Potash, and so on; one square alone being left without any manure whatever as a standard of comparison. Towards the end of July, the Wheat came into blossom, it was cut at the end of August, and threshed out early in September. During the growth of the plants and ripening of the grain, very marked distinctions were perceptible; these are described in the following details.

1. *Phosphate of Ammonia.* The quantity of this salt taken was rather more than 2 lbs. per rod or 3 cwt. per acre. The value of the salt can hardly be fairly compared with other saline manures, as, the demand for it being very small, it has not yet been made on a scale of any magnitude, and hence it is difficult to state

at what price it might be prepared. The salt employed in this experiment was pure ; for practical use of course a commoner and cheaper salt might be employed. The experimental squares were rather less than a rod each, the results are however all calculated for a rod and likewise for the acre.

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 58	14	<i>per acre</i> 4	4	18
Grain	10	10		15	21
Straw	42	8	3	0	80
Chaff	5	12		8	29

The proportion of corn to the whole produce therefore was as 1804 to 10000. The average weight of the seeds was ascertained by weighing a known number, generally from 1500 to 2000. One thousand seeds weighed 653 grains. The density of the wheat was found by weighing a given bulk ; a brass measure holding exactly the hundredth part of a bushel was used ; twelve weighings were made of each sample ; and the mean of the whole twelve taken as representing the average specific gravity of the wheat. The average weight of the standard measure full was 4167 grains, hence the bushel would weigh $59\frac{1}{2}$ lbs.

It is necessary to observe that the quantity of corn, its density, and the weight of a thousand grains, as given in the following pages, is throughout deduced from the undressed corn. It was not dressed or screened in any way, but the whole corn, just as it was threshed out, was taken ; hence some of the samples appear extremely light and cannot be fairly compared with dressed samples ; the weights are merely comparative, but cannot be taken as expressing the real goodness of the corn.

The effect produced on the growth of the young plants by this salt was very marked, in about a week after applying it the plants looked rather poor, a few of them being killed or the leaves turned brown ; in three weeks a decided improvement was visible, the blades were larger and greener than those in the squares numbered 3, 4, 5 and 6, and in fact looked very flourishing. The dark

colour of the blades and the superior height of the plants increased, and remained very marked until the wheat came into ear.

2. *Phosphate of Ammonia and Silicate of Potash.* The same quantity of Phosphate of Ammonia was used in this, as in the preceding experiment. The plants received in addition a quantity of pure silicate of Potash, corresponding to a hundred weight and a half per acre. The silicate employed was very pure, having been made by slowly fusing together white quartz sand, previously well boiled in nitro-muriatic acid and thoroughly washed, with pure carbonate of Potash. It was white, perfectly transparent, and entirely soluble in water. The silicate was applied to the plants in solution, a weak solution being poured between the rows, taking care not to wet the blades. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 58	0	<i>per acre</i> 4	2	109
Grain	6	8		9	40
Straw	45	7	3	4	105
Chaff	6	1		8	76

The proportion of corn to the whole crop was therefore as 1137 to 10000. One thousand seeds weighed 584 grains. The standard measure full weighed 4070 grains, hence the bushel would weigh $58\frac{1}{4}$ lbs. The remarks just made with respect to No. 1, Phosphate of Ammonia alone, may be equally applied to this square, which like No. 1 might until the plants came into ear be easily distinguished at a distance from the four following squares by the superior height and darker green colour of the blades. The quantity of corn produced both in Nos. 1 and 2 was less than had been expected from the appearance of the plants and the size and quantity of the ears formed; it is probable that a considerable portion of the corn was carried away from both these squares, but more particularly from No. 2, by the birds; it being more exposed than the other squares to their depredations.

3. *Sulphate of Soda.* The substance taken in this experiment was not a pure sulphate of Soda, but the impure salt, called Salt

cake, a substance manufactured on a very large scale by acting on common salt by sulphuric acid, for the purpose of being subsequently converted into carbonate of Soda or "Soda." Its value is about £3. 10s. per ton, hence the quantity applied would cost 10s. 6d. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 37	13	per acre 2	13	14
Grain	8	2		11	70
Straw	25	3	1	15	10
Chaff	4	8		6	46

The proportion of corn to the whole crop was therefore as 2188 to 10000. One thousand seeds weighed 610 grains. The brass standard measure full weighed 4114 grains, consequently the bushel would weigh $58\frac{3}{4}$ lbs. The plants in this as well as those in the succeeding square, No. 4, had throughout but a sickly appearance, they looked weak, and were a good deal laid by the wind, much more so than the two preceding squares, Nos. 1 and 2, although the latter plants were larger and taller than those in 3 and 4.

4. *Sulphate of Soda and Silicate of Potash.* The plants in the fourth square received these substances, at the rate of 3 cwt. of the former and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 47	13	per acre 3	9	46
Grain	8	3		12	58
Straw	36	10	2	13	62
Chaff	3	0		4	38

The proportion of corn to the whole crop was therefore as 1803 to 10000. One thousand seeds weighed 566 grains. The standard measure full weighed 3987 grains, consequently the bushel would weigh 57 lbs.

5. *Salt.* Common Salt was applied to this square at the rate of 3 cwt. per acre. This, reckoning salt at £1. 15s. per ton, would cost 4s. 6d. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 56	3	per acre 3	19	72
Grain	13	8		18	71
Straw	37	13	2	14	0
Chaff	4	14		7	1

The proportion of corn to the whole crop was therefore as

2339 to 10000. One thousand seeds weighed 731 grains. The standard measure full, weighed 4228 grains, consequently the bushel would weigh $60\frac{1}{2}$ lbs. The plants in this and the succeeding square, No. 6, looked throughout rather better than those in the two preceding squares Nos. 3 and 4; they were not, however, so much better as to have rendered it probable that the crop would be so much larger than Nos. 3 and 4, as the result proved it to be.

6. *Common Salt and Silicate of Potash.* Manured with these substances at the rate of 3 cwt. of the former, and $1\frac{1}{2}$ cwt. of the latter, per acre, the produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	47	13	3	8	44
Grain	8	3		11	81
Straw	36	10	2	12	37
Chaff	3	0		4	38

The proportion of corn to the whole crop was therefore as 1721 to 10000. One thousand seeds weighed 654 grains. The standard measure full weighed 4124 grains, consequently the bushel would weigh 59 lbs.

7. *Muriate of Ammonia.* Manured with this salt at the rate of 3 cwt. per acre, which, reckoning the salt worth £2. 2s. per cwt., would cost £6. 6s. per acre. In almost all the experiments made at the Horticultural Gardens with the salts of Ammonia, Muriate of Ammonia has produced a greater effect than the Sulphate or even the Phosphate. It is probable that this salt would for many soils be a very valuable manure. The price just quoted, which is that ordinarily stated, is however very high; and it becomes a question of some interest, whether it could not be obtained at a much lower cost. The common Muriate of Ammonia or Sal Ammoniac, is prepared chiefly from the Sulphate of Ammonia and Common Salt, which are mixed and then heated in a subliming apparatus. It is evident that for the purpose of manure, a more impure salt than that prepared by sublimation might be used. Perhaps the best process for preparing it would be to mix together Muriate of

Lime, a substance which can be procured at a very low cost, with Sulphate of Ammonia; when water is present these salts instantly decompose each other. The result of such a mixture would be Muriate of Ammonia and Sulphate of Lime, and would, probably, form an excellent manure. It might also be worth while to form Muriate of Ammonia by mixing Muriate of Lime and the crude Ammoniacal Gas liquor, in which case Muriate of Ammonia and Carbonate of Lime would result. The tarry matter always present in Ammoniacal liquor would perhaps be objectionable, hence the mixture of Sulphate of Ammonia and Muriate of Lime appears preferable. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	57	13	4	2	72
Grain	12	9		17	111
Straw	37	10	2	13	86
Chaff	7	10		10	99

The proportion of corn to the whole crop therefore was as 2176 to 10000. One thousand seeds weighed 700 grains. The standard measure full weighed 4173 grains, hence the bushel would weigh $59\frac{1}{2}$ lbs. In about three weeks from the time of applying the Salt, an evident alteration in the appearance of the wheat became visible; the plants were of a dark green colour, like those which had been manured with Phosphate of Ammonia, but even yet darker. They grew rapidly, the blades were large, and the plants very flourishing; they could readily be distinguished from the plants in 3, 4, 5 and 6, by their superior size and deep green colour. In consequence of the rankness of the plants, they were a good deal laid.

8. *Muriate of Ammonia and Silicate of Potash.* Manured with these substances at the rate of 3 cwt. of the former and $1\frac{1}{2}$ of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	70	3	5	14	65
Grain	10	8		15	0
Straw	67	15	4	17	12
Chaff	1	12		2	53

The proportion of grain to the whole crop therefore was as 1309

to 10000. One thousand seeds weighed 610 grains. The standard measure full weighed 4023 grains; hence the bushel would weigh $57\frac{1}{2}$ lbs. The plants in this, like those in the preceding square, were remarkable for their size and the deep green colour of their blades. They were rather stiffer and therefore less laid than those in No. 7.

9. *Phosphate of Lime.* The Phosphate employed was nearly pure, it was prepared from the super-phosphate of Lime formed by acting on Bone-ash by Sulphuric Acid. The ground was manured with it at the rate of $4\frac{1}{2}$ cwt. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 52	15	<i>per acre</i> 3	15	72
Grain	11	4		16	7
Straw	35	5	2	10	52
Chaff	6	6		9	13

The proportion of grain to the whole crop therefore was as 2123 to 10000. One thousand seeds weighed 628 grains. The standard measure full weighed 4166, hence the bushel would weigh $59\frac{1}{2}$ lbs. The plants in this and the following square were rather poor, and somewhat paler in colour than those in the standard square 13.

10. *Phosphate of Lime and Silicate of Potash.* Manured with these substances at the rate of $4\frac{1}{2}$ cwt. of the former, and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 55	7	<i>per acre</i> 3	19	9
Grain	11	9		16	37
Straw	39	2	2	15	105
Chaff	4	12		6	91

The proportion of grain to the whole crop therefore was as 2076 to 10000. One thousand seeds weighed 585 grains. The standard measure full weighed 4015 grains, hence the bushel would weigh $57\frac{1}{4}$ lbs.

11. *Muriate of Potash.* This Salt was applied at the rate of 3 cwt. per acre; it was nearly pure, and cost 18s. per cwt. There is however an impure Muriate of Potash known in trade under the

name of Petre salt, and costing about 4s. per cwt. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 58	10	<i>per acre</i> 4	3	70
Grain	13	10		19	25
Straw	39	10	2	16	75
Chaff	5	6		7	82

The proportion of grain to the whole crop therefore was as 2272 to 10000. One thousand seeds weighed 712 grains. The standard measure full, weighed 4233 grains; hence the bushel would weigh $60\frac{3}{4}$ lbs.

During the first few weeks after the application of this Salt, no effect whatever was perceptible; the plants looked poor, they grew up thin, and the blades were small, but they were stiff and the straw strong. When the wheat came into ear it looked far better than it had previously done, and the stiffness of the straw became more evident, for when those which had received Ammoniacal manures were all laid, the plants in this square were not laid at all. During the filling of the grain, a very remarkable effect was observed; the straw ripened and became of a bright yellow colour some time before that in most of the surrounding squares began to change. This effect which was very distinct and marked was perceived only in those squares which had been manured with Muriate and Sulphate of Potash, viz. 11, 12, 21 and 22, but in the two latter cases the appearance was less distinct than in those to which the Muriate of Potash had been applied.

12. *Muriate of Potash and Silicate of Potash.* These substances were applied at the rate of 3 cwt. of the former and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	<i>per rod</i> 61	5	<i>per acre</i> 4	7	1
Grain	10	7		14	24
Straw	47	7	3	7	94
Chaff	3	7		4	107

The proportion of grain to the whole crop therefore was as 1633 to 10000. One thousand seeds weighed 619 grains. The

standard measure full, weighed 4081 grains; hence the bushel full would weigh $58\frac{1}{2}$ lbs.

13. *No Manure.* This square, which was reserved as a standard of comparison with the other squares, received no manure whatever. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 40	6	per acre 2	17	77
Grain	7	10		10	98
Straw	30	2	2	3	7
Chaff	2	10		3	84

The proportion of grain to the whole crop therefore was as 1885 to 10000. One thousand seeds weighed 596 grains. The standard measure full weighed 4107 grains; hence the bushel would weigh $58\frac{3}{4}$ lbs.

In the early part of the experiment, shortly after the application of the manures, the plants in this square looked, if anything, rather better than any of the others; they seemed larger and fuller, and consequently this square appeared greener than those around it. After a few weeks however many of the squares, and more particularly those which had been treated with ammoniacal manures, far surpassed this in the size and colour of the plants. It was evident, as the wheat came into ear, that the straw was far weaker than that in the neighbouring squares; it was far more easily laid and recovered itself less rapidly than the wheat in other squares, even though the latter were larger and taller plants. On comparing the produce of this square with that of the others, it will be perceived that the quantity of grain is less than in any of the others, with the exception of that manured with Phosphate of Ammonia and Silicate of Potash in No. 2. It is probable, as has already been stated, that a considerable portion of the grain in that square was destroyed by birds.

14. *Silicate of Potash.* This square was manured with Silicate of Potash, at the rate of $1\frac{1}{2}$ cwt. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 48	6	per acre 3	9	11
Grain	9	3		13	12
Straw	34		2	8	62
Chaff	5	3		7	49

The proportion of grain to the whole crop therefore was as 1905 to 10000. One thousand seeds weighed 553 grains. The standard measure full weighed 3942 grains; hence the bushel would weigh $56\frac{1}{4}$ lbs. There was a decided improvement in the appearance of this wheat, over that of the standard square; the plants were larger, the ears finer, and the straw stiffer.

15. *Sulphate of Lime or Gypsum.* Applied at the rate of $4\frac{1}{2}$ cwt. per acre; it was finely powdered and spread over the ground as uniformly as possible. The price of Gypsum varies a good deal; reckoning it at 35s. per ton, the above quantity would cost 7s. $10\frac{1}{2}d.$ per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 60	11	per acre 4	6	90
Grain	14	0	1	0	6
Straw	41	5	2	19	8
Chaff	5	6		7	76

The proportion of grain to the whole crop therefore was, as 2310 to 10000. One thousand seeds weighed 639 grains. The standard measure full weighed 4204 grains, hence the bushel would weigh 60 lbs. Within a short time from the application of the Gypsum, the wheat exhibited an improved appearance, the blades were longer, and more healthy looking, though paler in colour than those of the standard. This superiority was evident during the whole time of their growth, but the difference was not so great as to make it probable that there would be so great a difference in the produce as there proved to be.

16. *Sulphate of Lime and Silicate of Potash.* These substances were applied at the rate of $4\frac{1}{2}$ cwt. of the former, and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	per rod 71	9	per acre 5	2	38
Grain	14	3	1	0	37
Straw	51	12	3	13	107
Chaff	5	10		8	6

The proportion of grain to the whole crop therefore was as 1986 to 10000. One thousand seeds weighed 645 grains. The standard measure full weighed 4077 grains, hence the bushel

would weigh $58\frac{1}{4}$ lbs. The same observations made to Gypsum alone 15 may be applied to this square, the plants in it were rather finer than in No. 16.

17. *Sulphate of Ammonia.* This salt was applied at the rate of 3 cwt. per acre. Sulphate of Ammonia is now made on a large scale from the refuse ammoniacal liquor of the gas works, either by the addition of Sulphuric Acid, or by a cheap sulphate, such as the Sulphate of Iron. The price of Sulphate of Ammonia is about 16s. per cwt.; the abovementioned quantity therefore would cost £2. 8s. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	60	3	4	6	9
Grain	12	6		17	82
Straw	41	7	2	19	26
Chaff	6	6		9	13

The proportion of grain to the whole crop therefore was as 2061 to 10000. One thousand seeds weighed 651 grains. The standard measure full weighed 4166 grains, hence the bushel would weigh $59\frac{1}{2}$ lbs. The plants in this and the following square 18 began to show a marked difference in about three weeks after the application of the salt; the plants grew very vigorously, and had the same deep green which distinguished those manured with Muriate of Ammonia, 7 and 8. If there was any visible difference between the effects produced by the Muriate and Sulphate, it was in favour of the former; the plants manured with that salt were perhaps a little more luxuriant than those treated with the Sulphate. The plants in this and the following square were rather less laid than those manured with the Muriate 7 and 8.

18. *Sulphate of Ammonia and Silicate of Potash.* These substances were applied at the rate of 3 cwt. of the former and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	50	6	4	6	41
Grain	11	11		16	85
Straw	46	2	3	5	100
Chaff	2	9		3	80

The proportion of grain to the whole produce therefore was as 1940 to 10000. One thousand seeds weighed 619 grains. The standard measure full weighed 4096 grains, hence the bushel would weigh $58\frac{1}{2}$ lbs.

19. *Sulphate of Magnesia, Epsom Salts.* This salt was applied at the rate of 3 cwt. per acre. Its value is about £12. per ton, hence the quantity used would cost £1. 16s. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	56	7	4	0	76
Grain	12	0		17	17
Straw	37	11	2	13	100
Chaff	6	12		9	71

The proportion of grain to the whole crop therefore was as 2125 to 10000. One thousand seeds weighed 671 grains. The standard measure full weighed 4170 grains, hence the bushel would weigh $59\frac{1}{2}$ lbs. The effect produced by this salt on the growth of the wheat appeared to be small, the plants looked very little better than those in the standard square; the straw appeared to be rather stronger.

20. *Sulphate of Magnesia and Silicate of Potash.* These substances were applied at the rate of 3 cwt. of the former and $1\frac{1}{2}$ cwt. of the latter per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	58	13	4	4	6
Grain	12	5		17	65
Straw	43	8	3	2	15
Chaff	3	0		4	38

The proportion of grain to the whole crop therefore was as 2091 to 10000. One thousand seeds weighed 624 grains. The standard measure full weighed 4106 grains, hence the bushel would weigh $58\frac{3}{4}$ lbs.

21. *Sulphate of Potash.* This salt was applied at the rate of 3 cwt. per acre. Sulphate of Potash is the residue of the ordinary process for the manufacture of Nitric Acid, in which Nitrate of Potash is decomposed by Sulphuric Acid. The price of the Sulphate varies, in part depending on the price of the Nitrate, its

average value is about £14 per ton, hence the above quantity would cost £2. 2s. per acre. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	47	7	3	7	87
Grain	10	11		15	34
Straw	30	13	2	3	107
Chaff	5	15		8	58

The proportion of grain to the whole crop therefore was as 2257 to 10000. One thousand seeds weighed 651 grains. The standard measure full weighed 4195 grains, hence the bushel would weigh 60 lbs.

This salt decidedly produced a beneficial effect on the wheat; the plants were large and flourishing, the straw appeared stiffer than most of the others, and when the wheat had come into ear and the grains were ripening, the remarkable change in colour adverted to when describing the effect produced by Muriate of Potash, was observed.

22. *Sulphate of Potash and Silicate of Potash.* These substances were applied at the rate of 3 cwt. of the former and $1\frac{1}{2}$ cwt. of the latter, the produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	72	0	5	4	66
Grain	12	0		19	23
Straw	55	4	3	18	64
Chaff	4	12		6	91

The proportion of grain to the whole crop was therefore as 1836 to 10000. One thousand seeds weighed 610 grains. The standard measure full weighed 4069 grains. Hence the bushel would weigh $58\frac{1}{4}$ lbs. The plants in this square were very large and healthy, the straw was remarkably stiff, and the ears were larger and full. On comparing together all the squares manured with Silicate of Potash, the plants in this square appeared the finest.

23. *Nitrate of Soda.* This salt was applied at the rate of 3 cwt. per acre. At the present price of £17. per ton, this quantity would cost £2. 11s. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	59	6	4	4	109
Grain	11	10		16	72
Straw	41	11	2	19	70
Chaff	6	1		8	79

The proportion of grain to the whole crop therefore was as 1958 to 10000. One thousand seeds weighed 651 grains. The standard measure full weighed 4242 grains. Hence the bushel would weigh $60\frac{1}{2}$ lbs. The Nitrate of Soda in this and the following square produced a very luxuriant growth, closely resembling that caused by the salts of Ammonia; the plants appeared to be weaker than those manured with ammoniacal compounds, for though no larger, they were more laid than the others were.

24. *Nitrate of Soda and Silicate of Potash.* These substances were applied at the rate of 3 cwt. of the former, and $1\frac{1}{2}$ of the latter. The produce was

	lbs.	oz.	ton.	cwt.	lbs.
Whole crop	56	15	4	1	46
Grain	9	8		13	63
Straw	42	4	3	0	46
Chaff	5	3		7	49

The proportion of grain to the whole crop therefore was as 1666 to 10000. One thousand seeds weighed 562 grains. The standard measure full weighed 3952 grains. Hence the bushel would weigh $56\frac{1}{2}$ lbs.

From the comparatively small scale on which these experiments were made, it is evident that the results cannot be considered as giving exactly the relative effects produced by the different manures employed, the experiments were however carefully made, and possess considerable interest in themselves, even independent of the chemical enquiries to which they will hereafter lead.

Perhaps the fairest mode of judging of the effect produced by these manures, was to compare the growing crops together, previous to their coming into ear, the differences were then very marked, it was evident that by far the greatest effect was throughout produced by the salts of Ammonia and the Nitrate of Soda. The most remarkable effect of all was produced by Muriate of Ammonia; the plants manured with this salt were distinguished not only by the luxuriance of their growth, but likewise by the very deep blue green colour of the foliage, those manured with Sulphate of

Ammonia were not quite so rank, whilst those manured with Phosphate of Ammonia and Nitrate of Soda, though as large and flourishing as those treated with Muriate of Ammonia, were not quite so dark in colour. Next in size and appearance were the plants manured with Sulphate of Potash, then those manured with Sulphate of Lime and Sulphate of Magnesia. The Muriate of Potash appeared to exert but little influence until the wheat came into ear. The other salts did not in any material way affect the appearance of the wheat. A slight beneficial effect was throughout produced by the Silicate of Potash, each square to which it had been applied, in conjunction with a saline manure, looked better than the corresponding square to which the Silicate had not been applied.

The crops were attentively watched from time to time to ascertain whether any of them were more liable to blight or diseases than the others, but no such effect was observed, a few smutty ears were found in most of the squares, and in a few places red rust appeared, but it did not seem that there was any connexion between those diseases and the manures employed.

A number of grains of wheat selected from each square, was sown in similar soil, and exposed to the same circumstances, to ascertain whether there was any difference in the time required for germination. In the first trial, considerable differences appeared to exist in the rapidity of germination; the seeds from those squares which had been manured with Silicate of Potash, all came up first; this was however probably due to some accidental circumstance, for on repeating the experiment with greater care no appreciable difference was perceptible.

For the convenience of reference some of the numerical results of the preceding experiment are arranged in the following tables.

I. Table shewing the whole quantity of grain, and also the increased produce with each manure, calculated for the acre.

8. Muriate of Ammonia and Silicate of Potash	4	17	12	1	14	5

A series of experiments with similar saline manures was also made with POTATOES. Twelve squares were planted with Bread fruit Potatoe on the 20th of March. The cuttings were as nearly as possible of the same size, and came up tolerably regularly. On the 12th of May, when most of the young plants were from two to four inches above ground, the manures were applied; they were not sown broadcast over the whole bed, but sprinkled as uniformly as possible on each side of the row of young plants, to a distance of about six inches. The salts used were the same as those applied to the wheat, with the exception of the Silicate of Potash, namely, the Phosphate, Muriate, and Sulphate of Ammonia, Sulphate, Muriate, and Nitrate of Soda, Sulphate and Muriate of Potash, Sulphate and Phosphate of Lime, and Sulphate of Magnesia, whilst the twelfth square was left without any manure as a standard of comparison. In about three weeks after applying the manure, it was evident that four of the squares, namely, those to which the Salts of Ammonia and Nitrate of Soda, had been applied, were distinguished from the others by more vigorous growth, and rather

darker foliage. About five weeks after applying the salts, the standard square and that treated with Sulphate of Lime, were the poorest, those which had Muriate of Potash and Phosphate of Lime, were rather finer; those manured with Sulphates of Soda, Magnesia, and Potash, still better; that which had been manured with common Salt, resembled in size and appearance those which had been treated with the sulphate, but the foliage was remarkably pale in colour; whilst those manured with Ammoniacal Salts and Nitrate of Soda, were distinguished from all the others, by the plants being several inches higher, having much thicker stems, and a rich dark green foliage. One of the rows in the bed manured with Muriate of Ammonia had from some cause failed, at least the plants had not come up at the time of applying the manures, within a very short time afterwards, however, they came up, and grew with such vigour and luxuriance that in a few weeks it was impossible to distinguish them from the other plants similarly manured. The plants continued to grow until the end of August, and the same general distinctions already mentioned, were evident to the last. The ammoniacal manures and the Nitrate of Soda produced the finest plants, but the differences between the squares though evident, were far less marked at the end of August, than they had been at the end of June, and through the whole of July. It appeared as if the four manures just referred to, produced a powerful effect on the plants for the first six weeks, and caused them to grow with great vigour, so that they soon came to their full size, after which they ceased to grow; whilst the plants in the other squares never made any rapid growth, but continued to grow slowly and steadily until the tops began to die off. In the middle of September, as the greater part of the tops were either dead or dying, they were gathered, and the potatoes taken up. The different manures were all applied at the rate of three hundred weight per acre, excepting the Phosphate and Sulphate of Lime, both of which were used at the rate of four and a half hundred weight per acre.

The quantity of Potatoes yielded by each square was as follows : the quantity of large or marketable Potatoes being distinguished from the small ones.

No. 1. Manured with Phosphate of Ammonia at the rate of 3 cwt. per acre. The produce was

	cwt.	lbs.	ton.	cwt.	lbs.
Large tubers	<i>per rod</i> 1	53	<i>per acre</i> 11	16	78
Small tubers		17		13	40
Total	1	72	13	2	6
Dry haulm		6½		9	0

No. 2. Manured with Sulphate of Soda at the rate of 3 cwt. per acre. The produce was

No. 12. Manured with Nitrate of Soda at the rate of 3 cwt. per acre. The produce was

	cwt.	lbs.	ton.	cwt.	lbs.
Large tubers <i>per rod</i> 1		84	<i>per acre</i> 14	1	22
Small tubers		20	1	8	67
Total	1	104	15	9	88
Dry haulm		7½		10	36

The proportion of tubers is by no means what might have been expected from the apparent size of the plants; there was very little difference perceptible between the plants manured with the three salts of Ammonia, the plants were equally healthy and no difference

could be seen in their size or appearance, yet the produce varied greatly, for on comparing the effect produced, it appears that the sulphate produced about twice the effect of the phosphate; and the muriate about twice as much as the sulphate. The following table exhibits the relative effect produced by each manure, on the tubers as well as on the haulm, the weight of the green haulm may readily be calculated by reckoning 100 lbs. of the green for every 11 lbs. of the dry plant.

Manure.	Whole produce tubers.			Increase per acre.			Large tubers.			Increase per acre.			Whole haulm.		Increase per acre.	
	ton.	cwt.	lbs.	ton.	cwt.	lbs.	ton.	cwt.	lbs.	ton.	cwt.	lbs.	cwt.	lbs.	cwt.	lbs.

Muriate of Ammonia	17	1	75	5	13	78	16	15	7	6	10	14	15	77	9	38

Shortly after this experiment was commenced, three other squares of bread fruit Potato, in another part of the garden, were manured with Carbonate of Ammonia, Nitrate of Ammonia, and Muriate of Lime. The soil where these substances were applied, was richer, than where the above described experiments were made; and the fact that the salts were applied rather late, renders it impossible to compare the produce of the two experiments. The Nitrate and Carbonate of Ammonia, produced far less effect either on the haulm or tubers, than the other salts of Ammonia, which were applied to the plants in a younger state. The Muriate of Lime did not exert much influence on the growth of the tops, but it increased the yield of tubers nearly one fourth.

A third series of experiments was made with PEAS. Twelve squares were sown with Blue Prussian Peas, on the 20th of March and on the 19th of April the plants being about 3 inches high, they were manured with the same series of manures as had been

applied to the Potatoes, namely, Phosphate, Muriate and Sulphate of Ammonia, Sulphate of Soda, Nitrate of Soda, Common Salt, Phosphate and Sulphate of Lime, Sulphate and Muriate of Potash and Sulphate of Magnesia, the twelfth square being left untouched for comparison. The effects produced by these manures were far less marked than had been anticipated, the plants in all the squares grew well, and no luxuriant growth or darker coloured foliage indicated the ammoniacal manure, as had been the case with the Potatoes and Wheat. The only squares in which any difference could be perceived were those to which Common Salt and Nitrate of Soda had been applied, but even in these the superiority above the others was so very slight that it could not be perceived without a careful comparison. About the middle of August the plants ceased to produce pods and began to wither up, they were therefore gathered and the seed threshed out. The following table shews the produce in seed and the weight of dry straw, produced by each square.

	Rod.				Acre.				
	Seed.		Straw.		Seed.		Straw.		
	lbs.	oz.	lbs.	oz.	ton.	cwt.	lbs.	cwt.	lbs.
Nitrate of Soda	11	8½	9	7	16	54	13	57	
Phosphate of Ammonia	12	12	8	14½	18	31	12	80	
Salt	12	6	10	9	17	76	15	11	
Sulphate of Soda	13	0	9	7½	18	64	13	57	
Sulphate of Lime	13	1	9	11¾	18	75	13	101

Nothing	15	5½	9	7	1	1	104	16	54
Muriate of Ammonia	15	12½	12	8	1	2	61	17	98

A fourth series of experiments was made with MANGEL WURZEL. Sixteen squares sown with Red Mangel Wurzel on the 12th of May, were manured on the 26th of June; the various substances being applied as a top dressing, sprinkled round the young plants, as was done with the Potatoes, to a distance of about 6 inches on either side of the rows. The plants were 12 inches apart and the distance between the rows was 24 inches. The roots were taken

up on the 23rd of November and weighed. The following were the manures employed and the produce they yielded.

No. 1. Manured with Muriate of Lime at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	4	13	5	98	46	19	88
Tops		11 $\frac{3}{4}$		100	7	4	7
Total	5	8 $\frac{3}{4}$	6	86	54	3	85

No. 2. Manured with Phosphate of Ammonia at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	11	4	53	35	15	79
Tops		7		59	4	5	1
Total	4	2	5	0	40	0	80

No. 3. Manured with Sulphate of Potash at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	14	4	80	37	14	55
Tops		8 $\frac{1}{2}$		72	5	2	93
Total	4	6 $\frac{1}{2}$	5	40	42	17	36

No. 4. Manured with Muriate of Ammonia at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	6	4	13	32	18	101
Tops		10		85	6	1	49
Total	4	0	4	98	39	0	38

No. 5. Manured with Nitrate of Potash, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	12	4	67	36	16	53
Tops		8 $\frac{1}{2}$		69	4	18	80
Total	4	4 $\frac{1}{2}$	5	24	41	15	21

No. 6. Manured with Common Salt, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	15	4	94	38	14	97
Tops		8 $\frac{1}{2}$		72	5	2	93
Total	4	7 $\frac{1}{2}$	5	54	43	17	78

No. 7. Manured with nothing, left as a standard of comparison.
The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	2	3	96	30	17	43
Tops		6½		53	3	16	11
Total	3	8½	4	37	34	13	54

No. 8. Manured with Muriate of Potash, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	9	4	40	34	16	101
Tops		7¾		68	4	15	77
Total	4	0¾	4	108	39	12	66

No. 9. Manured with Nitrate of Soda, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	8	4	29	34	2	2
Tops		8½		71	5	2	5
Total	4	0½	4	99	39	4	7

No. 10. Manured with Sulphate of Magnesia, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	3	3	103	31	7	108
Tops		6¾		58	4	3	6
Total	3	9¾	4	49	35	11	2

No. 11. Manured with Sulphate of Soda, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	4	2	104	32	7	17
Tops		5¾		49	3	10	57
Total	3	9¾	3	41	35	17	74

No. 12. Manured with "Superphosphate of Lime," at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	2	11	3	35	26	10	90
Tops		5½		46	3	8	18
Total	3	0½	3	81	29	18	108

No. 13. Manured with Carbonate of Soda, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	5	3	103	32	13	47
Tops		6½		57	4	1	30
Total	3	11½	4	48	36	14	77

No. 14. Manured with Sulphate of Ammonia, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	2	5	2	96	22	17	62
Tops		6		51	3	13	72
Total	2	11	3	35	26	11	22

No. 15. Manured with Phosphate of Soda, at the rate of 6 cwt. per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	2	10	3	23	25	13	19
Tops		5½		48	3	8	62
Total	2	15½	3	71	29	1	81

No. 16. Manured with Rotten Dung, at the rate of 65 cubic yards per acre. The produce was

	Average weight.		Rod.		Acre.		
	lbs.	oz.	cwt.	lbs.	ton.	cwt.	lbs.
Roots	3	7	4	26	33	16	101
Tops		8		68	4	15	65
Total	3	15	4	94	38	12	54

The following table shews the increase of produce caused by each manure, calculated per acre.

	Roots:			Tops.			Roots and Tops.		
	Whole.	Increase.		Whole.	Increase.		Whole.	Increase.	
	ton.	cwt.	lbs.	ton.	cwt.	lbs.	ton.	cwt.	lbs.

Carbonate of Soda	32	13	47	1	16	4	36	14	77
Muriate of Ammonia	32	18	101	2	1	58	39	0	38
Rotten Dung	33	16	101	2	19	58	38	12	54
Nitrate of Soda	34	2	2	3	4	71	39	4	7
Muriate of Potash	34	16	101	3	19	58	39	12	66
Phosphate of Ammonia	35	15	79	4	18	36	40	0	80
Nitrate of Potash	36	16	53	5	19	10	41	15	21
Sulphate of Potash	37	14	55	6	17	12	42	17	36
Common Salt	38	14	97	7	18	54	43	17	78
Muriate of Lime	46	19	88	16	2	45	54	3	85

There are several points worthy of notice in these experiments, amongst which is the effect of MURIATE OF LIME. In nearly all the experiments which have been made at the Gardens, marked effects have been produced by manures containing Muriatic acid; hence it was reasonable to conclude beforehand that the Muriate of Lime would prove a good manure. Other considerations gave it a still higher interest; from previous experiments it had been ascertained that a very small quantity of Muriate of Lime in a soil, exerted, in consequence of its hygrometric properties, powerful influence on the retentive power of the soil for moisture. It was, however, apprehended that the presence of any quantity of the salt, even though small, might prove injurious to vegetation. The experiments above described shew that this is not the case; the quantity employed was considerable, and so far from doing any harm, it on the contrary produced a very excellent effect.

The experiments on the HYGROMETRIC POWERS OF SOILS, just referred to, were part of an extensive series, undertaken with a view of ascertaining what influence saline manures exert on the retention of moisture. Weighed quantities of natural and artificial soils of various natures were moistened, some with pure water, and others with water holding in solution minute quantities of different saline substances; the soils were carefully weighed from day to day, and the daily loss of water, subtracted from the original quantity of moisture which the soils contained, shewed the relative retentive power of the soil under examination. The following short table shews the result of one of those experiments in which twenty-five portions of fine siliceous sand weighing 2000 grains each, were each moistened with 500 grains of pure water, and weighed every day. To the first five portions nothing but the water was added, the next five received in addition one grain of Muriate of Lime, the next five two grains of that salt, the next five, five grains, and the remainder ten grains of the Muriate.

The mean of each five weighings, alone is given; the numbers shew the weight of water retained by each portion during the experiment.

	Water only.	One Grain Muriate of Lime.	Two Grains Muriate of Lime.	Five Grains Muriate of Lime.	Ten Grains Muriate of Lime.

In the experiment on Mangel Wurzel, it is remarkable that no effect appeared to be produced by the Sulphate of Ammonia, or by the Super-phosphate of Lime; two manures which had been expected to produce the most marked effects. When the manures were applied, it was observed that the squares Nos. 12 and 14, looked rather poorer than the others; the young plants were smaller, and less flourishing; it was for this reason that the two manures supposed to be the most powerful were applied to them, but the plants did not improve, and remained inferior in size and appearance to the last. It is proper to state this, or otherwise the experiment might appear unfavourable to the use of those manures, which would certainly be an incorrect conclusion.*

* The value of these substances, as manures, is every day becoming more evident. The Superphosphate of Lime in particular, is producing excellent effects. At the time when the above-described experiments on Mangel Wurzel were made at the Gardens, my friend, Mr. H. Aglionby, M.P. made others with green round Turnips, on very poor soil, on which the superphosphate produced a larger crop than any other manure. In these experiments, Sulphate of Ammonia, *drilled in under the seed*, failed entirely; on very chalky soil the whole crop was destroyed, and on clayey soil it was evidently greatly injured, though not to the same extent as on chalk. This salt appears to be decidedly best as a top dressing, either mixed with mould or road drift.

As has already been stated, the series of practical experiments in these crops were undertaken with a chemical object in view; it is almost unnecessary to observe, that the relative quantity of produce obtained by each manure, was a matter of comparatively secondary importance; the main object was to connect changes in chemical composition, or quality, with the action and absorption of inorganic manures. In attaining these objects, the richness or variable composition of the soil, exerts little influence, though in judging of the relative practical effects of the manures employed, it causes such irregularities and discrepancies, as to take from the results all pretensions to rigid accuracy in that respect. Very marked differences were produced in the plants experimented on, by the salts applied; and it now remains to investigate the quality and nature of the substances absorbed by the different crops thus manured. The result of that investigation will be the subject of a future communication to the Society.

38, *Bedford Row,*

Jan. 10, 1844.

IV. *The result of some Experiments in the Garden of the Society on the action of Fertilizing Agents upon the Lawn.*

(Communicated by the GARDEN COMMITTEE.)

LIKE all places, which have been long cultivated, the Garden of the Horticultural Society is by no means well suited to experiments with manures. Nevertheless it has appeared desirable to employ it for such ends, *quantum valet*, and accordingly, among other things, attempts have been made to ascertain the effects of various manuring agents upon the grass of lawns. The results of these experiments are now detailed.

The lawn in the Society's Garden was the scene of operations, and the experiments were necessarily brought to a close in the beginning of May, before the grass could run up into hay; so that the results about to be mentioned do not express the quantity of produce per acre with reference to a hay crop, but merely the relative productiveness of the ground under equal circumstances.

The notes upon them were made at four different times during the season, first in November, shortly after the application of the manures; secondly, in the beginning of February; thirdly, in the beginning of April, and fourthly, on the day when the grass was cut and weighed. The printed remarks are the substance of all such notes, but more particularly of those made at the time when it was cut.

Each experiment occupied one rod of ground, and great care was taken that the soil and lawn should be as nearly as possible the same in each experiment. A part of the trials was made in the months of October and November 1842, the remainder in March 1843, with a view to a determination of the difference which season makes in the application of such substances. The following table shews with what success.

Experiments on Lawns.

No.	Date of Application.	Date of cutting the grass.	Substances used.	Quantity per acre.	Produce per acre green.	Produce per acre dry.	Remarks.
1	1842. Oct. 21.	1843. May 4.	Woolwich Humus.	2 tons.	T. Cwt. lbs. 2 18 64	T. Cwt. lbs. 0 8 64	No perceptible difference between this square and the ordinary grass.
2	Ditto.	Ditto.	Soot.	2 cwt.	2 18 64	0 8 64	Slightly greener than the ordinary grass.
3	Ditto.	Ditto.	Nitrate of Soda.	1 cwt.	3 8 64	0 11 48	Rather greener and longer, but no very perceptible difference.
4	Ditto.	Ditto.	Ditto.	2 cwt.	3 17 16	0 15 80	Like the last, but slightly greener.
5	Ditto.	Ditto.	Nitrate of Potash.	1 cwt.	3 8 64	0 11 50	Very slightly greener than the common grass.
6	Ditto.	Ditto.	Ditto.	2 cwt.	4 12 96	0 15 80	Greener and much stronger than the last.
7	Ditto.	Ditto.	Sulphate of Soda.	2 cwt.	3 11 48	0 11 50	No perceptible difference between this and the ordinary grass in colour, but rather thicker and longer.
8	Ditto.	Ditto.	Gas water.	320 gall.	6 8 64	1 1 50	Quite burnt and brown in 48 hours after application and to all appearance dead, but the grass began to recover in 10 days, and in a month became quite green. The white clover was destroyed.
9	Ditto.	Ditto.	Ditto.	640 gall.	6 7 18	1 4 34	Much burnt like the last, and in less time, the square began to recover in about 14 days, but part of the grass was quite killed. That which recovered grew much stronger than any in the preceding square, the clover was entirely destroyed.
10	Ditto.	Ditto.	Gas Lime.	1 ton.	4 8 64	0 15 80	Slightly greener than the common grass but rather thicker.
11	Ditto.	Ditto.	Ditto.	2 tons.	3 4 32	0 12 98	Like the last; slightly greener but rather slenderer than the common grass.
12	Ditto.	Ditto.	Sulphate of Iron.	25 lbs.	2 0 0	0 7 16	No difference in colour, but rather slenderer and thinner than the ordinary grass.
13	Ditto.	Ditto.	Ditto.	50 lbs.	2 0 0	0 8 64	Like the preceding in colour, but stiffer in appearance.
14	Ditto.	Ditto.	Ditto.	100 lbs.	2 12 96	0 12 96	Like the preceding in colour, but rather stronger and a little longer.
15	Ditto.	Ditto.	Muriate of Lime.	2 cwt.	2 10 0	0 7 16	Rather injurious at first, afterwards no visible difference between this and the ordinary grass.
16	Ditto.	Ditto.	Charcoal dust.	2 cwt.	3 0 0	0 7 16	No perceptible difference between this and the ordinary grass.

No.	Date of Application.	Date of cutting the grass.	Substances used.	Quantity per acre.	Produce per acre green.	Produce per acre dry.	Remarks.
17	1842. Oct. 21.	1843. May 4.	Chloride of Lime.	1 cwt.	T. Cwt. lbs. 4 14 32	T. Cwt. lbs. 0 14 32	Partially burnt in a week after application, and the burning seemed to injure the roots as well as the tops. After the grass recovered, there was no perceptible difference between it and the common grass, but the clover grew remarkably strong in this square the following spring.
18	Ditto.	Ditto.	Ditto.	2 cwt.	3 1 48	0 8 6	More burnt than the last, and the grass much injured. Clover strong and abundant in the spring.
19	Ditto.	Ditto.	Sulphate of Copper.	25 lbs.	2 1 48	0 5 80	No perceptible effect on the grass, no annuals or weeds left alive, but the moss not injured.
20	Ditto.	Ditto.	Ditto.	50 lbs.	2 1 80	0 5 80	Like the last.
21	Ditto.	Ditto.	Ditto.	100 lbs.	2 10 0	0 7 16	Like the last.
22	Ditto.	Ditto.	Daniel's Manure.	2 cwt. 37 lbs. or 80 gallons.	2 5 80	0 7 18	No effect.
23	Ditto.	Ditto.	Gypsum.	320 lbs.	2 7 16	0 7 16	No effect.
24	Ditto.	Ditto.	NOTHING.		2 14 32	0 8 64	
25	Ditto.	Ditto.	Gypsum.	640 lbs.	2 2 96	0 5 82	No perceptible difference in colour but the grass appeared slenderer than in either of the two preceding squares.
26	Ditto.	Ditto.	Gypsum and Gas water.	320 lbs. 160 gall.	2 17 16	0 11 0	Very much burnt in 48 hours after application; began to recover in 10 days, became very green and long, but not so strong or so fine as the next square.
27	Ditto.	Ditto.	Ditto.	640 lbs. mixed with 320 gallons.	5 14 32	1 2 96	Like the preceding very much burnt; much longer in recovering; it afterwards grew very strong and green. Some of the grass in this square was killed, but the remainder soon covered the place of that which was destroyed.
28	Ditto.	Ditto.	Guano.	2 cwt.	2 1 48	0 8 64	Very slightly but perceptibly greener than the ordinary grass.
29	Oct. 25.	May 9.	Gas water fixed with Sulphuric acid.	320 gall. 20 lbs.	6 2 98	1 4 32	This only slightly marked the grass, and did not destroy the top. It became very green in a much shorter time, and stronger. Daisies and all annual weeds and moss were destroyed, and the clover became weak and thin.
30	Ditto.	Ditto.	Gas water fixed with Sulphate of Iron.	320 gall. 20 lbs.	5 8 66	1 0 0	Like the preceding in colour and other respects, except that it is not quite so strong; little or no clover appeared in this square.
31	Ditto.	Ditto.	Gas water and sulphate of copper.	320 gall. 20 lbs.	5 8 64	0 18 64	Not nearly so fine as the two preceding squares, but very green, with a large quantity of clover; but no weeds.

No.	Date of Application.	Date of cutting the grass.	Substances used.	Quantity per acre.	Produce per acre green.	Produce per acre dry.	Remarks.
32	1842. Oct. 25.	1843. May 9.	Gas water and Chloride of Lime.	320 gall. 80 lbs.	T. Cwt. lbs. 5 2 96	T. Cwt. lbs. 1 0 0	Stronger and thicker than the last, but not so long; in other respects the same; no clover.
33	Ditto.	Ditto.	Corrosive Sublimate.	20 gall. of the saturated solution.	2 4 34	0 7 16	No difference between this and the ordinary grass; certainly not injurious; worms abundant in this square.
34	Ditto.	Ditto.	Wood Ashes	4 cwt.	1 17 16	0 4 32	Grass very thin.
35	Ditto.	Ditto.	Gypsum.	2 cwt.	1 4 32	0 2 98	Grass very thin.
36	Ditto.	Ditto.	Ditto.	4 cwt.	1 18 64	0 4 32	The grass a little longer, but nearly as in the preceding square; rather yellow.
37	Nov. 7.	Ditto.	Sulphur.	cwt. lbs. 2 96	1 14 32	0 4 32	Rather yellow and stunted.
38	Ditto.	Ditto.	Gas liquor. Water.	240 gall. 240 gall.	3 14 32	0 12 98	Very green and fine with a little weak clover.
39	Ditto.	Ditto.	Gas liquor. Water.	200 gall. 280 gall.	2 5 82	0 8 64	Less robust and green than the preceding.
40	Ditto.	Ditto.	Gas liquor. Water.	160 gall. 320 gall.	2 2 96	0 7 16	Less strong and green than the last.
41	Ditto.	Ditto.	Gas liquor. Water.	120 gall. 360 gall.	2 1 17	0 7 0	Like the last.
42	Ditto.	Ditto.	Gas liquor. Water.	80 gall. 400 gall.	1 17 16	0 4 34	Very slight difference between this and the ordinary grass; a little greener.
43	Ditto.	Ditto.	Gas liquor. Water.	40 gall. 440 gall.	1 2 96	0 2 98	Hardly any difference between this and the ordinary grass; slightly greener.

47	Nov. 9.	Ditto.	Strong nitric acid.	10 gall.	3 2 96	0 8 64	Much greener and longer than the ordinary grass.
48	Ditto.	Ditto.	Strong muriatic acid.	10 gall.	3 0 0	0 8 64	Longer but not greener than the ordinary grass.
49	Ditto.	Ditto.	Nitro-muriatic acid.	10 gall.	2 14 32	0 7 16	No visible difference.
50	Ditto.	Ditto.	Pearlash.	3 ct. 4 lb.	1 17 6	0 4 34	Rather injurious; burnt the grass at first.
51	Ditto.	Ditto.	Grass cuttings rotted with gas water.	4 tons.	1 8 64	0 2 98	Strong and green in January; no perceptible difference in April. Probably checked by the cold spring.
52	Ditto.	Ditto.	Urate.	1 ton.	1 17 16	0 4 32	No difference between this and the common grass.
53	Ditto.	Ditto.	Chatwin's artificial manure No. 3.	1 ton.	1 15 80	0 4 34	Very green and strong in January, but no difference between it and the ordinary grass in April. See No. 51.
54	Ditto.	Ditto.	Woolwich Humus.	1 ton.	2 10 0	0 7 18	Slightly greener in January and thicker but in April hardly different in colour from the ordinary grass. See No. 51. [when cut.
55	Ditto.	Ditto.	Lance's Carbon.	1 ton.	1 15 80	0 4 32	No effect. The grass appeared tough

No.	Date of Application.	Date of cutting the grass.	Substances used.	Quantity per acre.	Produce per acre green.	Produce per acre dry.	Remarks.
56	1842. Nov. 9.	1843. May 9.	Bone dust	1 ton.	T. Cwt. lbs. 1 15 80	T. Cwt. lbs. 0 5 80	Slightly stronger, but not greener.
57	Ditto.	Ditto.	Clark's Aimatic compost	1 ton.	1 4 34	0 2 98	Hardly so strong as the ordinary grass, but a little greener in January.
58	Ditto.	Ditto.	Dutch manure or Black powder.	2 cwt.	2 7 16	0 7 16	Thicker but not greener than the common grass.
59	Ditto.	Ditto.	Sulphate of Soda.	4 cwt.	1 12 96	0 4 32	No perceptible difference between this and the ordinary state of the grass.
60	Nov. 23.	Ditto.	Poittevins highly concentrated manure.	12½ cwt.	2 7 16	0 7 16	Slightly greener and thicker than common.
61	Ditto. 1843.	Ditto.	Poittevins disinfected manure.	12½ cwt.	1 18 64	0 4 34	No effect.
62	March 1	Ditto.	Nitrate of Soda.	2 cwt.	4 1 48	0 12 96	Very strong and green and the growth very rapid after the first rain.
63	Ditto.	Ditto.	Gas water.	320 gall.	7 11 48	1 2 96	Much burnt in 4 days; quite brown; recovered in 10 days; on the 1st of April very green and strong. This was less injured by the Gas water than when applied in the autumn, but a great part of the grass seems damaged by the cutting, although it was wet weather after it was cut. It eventually recovered. No clover or other plants made their appearance.
64	Ditto.	Ditto.	Gypsum.	320 lbs.	3 1 48	0 10 0	Thicker, but not greener than the ordinary grass.
65	Ditto.	Ditto.	Woolwich Humus.	1 ton.	2 8 64	0 8 64	No perceptible effects.
66	Ditto.	Ditto.	Gas water and Gypsum.	160 gall. 160 lbs.	7 0 2	1 0 2	Not so much burnt as No. 63; yet very brown in 4 days; recovered in 7 days; became very green and strong, and was not injured by the cutting afterwards. The clover was nearly destroyed.
67	Ditto.	Ditto.	Pure Sulphate of Ammonia.	320 lbs.	5 7 18	0 17 18	Partially burnt in 4 days when first applied; recovered in 14 days, and became very strong and green. Grew well after having been cut.
68	Ditto.	Ditto.	Ditto.	640 lbs.	7 1 48	1 0 2	Like the last; partially burnt at first but much injured afterwards when rain came; in some parts the grass was killed; but the remainder soon recovered, and became more vigorous than the preceding. The second growth was very strong and green.
69	March 3.	Ditto.	Gas water Sulphuric acid and Chloride of Lime.	160 gall. 160 lbs. 160 lbs.	3 8 66	0 11 48	Rather greener than the common grass, and longer but not so thick, it began to lose its colour before it was cut.
70	Ditto.	Ditto.	Pure Phosphate of Ammonia.	¼ cwt.	4 11 48	0 14 32	Slightly greener than the common grass; but thicker. This became greener the longer it stood, and it produced a finer texture and thicker grass, but not much longer.

It is no doubt true that these, like all other single experiments, are open to objection ; and that the conclusions to which they seem to point cannot be regarded as entirely satisfactory. Nevertheless they are by no means undeserving consideration.

In every case the manures in which AMMONIA is a principal ingredient proved by far the most effectual. For example while unmanured ground produced of dry grass per acre, 8 cwt. 64 lbs., and Nitrate of soda, and Nitrate of Potash, at 2 cwt. per acre yielded only 15 cwt. 80 lbs., Ammoniacal manures gave as follows: Gas water fixed with Sulphate of iron, 1 ton ; the same mixed with Bleaching powder, 1 ton ; Gas water alone, (320 gallons per acre), 1 ton 1 cwt. 50 lbs. ; Gas water fixed with Gypsum, 1 ton 2 cwt. 96 lbs. ; the same fixed with Sulphuric acid, 1 ton 4 cwt. 32 lbs. ; the same alone (640 gallons per acre), 1 ton 4 cwt. 34 lbs.

It also appeared that BLEACHING POWDER (Chloride of lime) produces effects nearly equal to those of Nitrate of soda. For 2 cwt. of soda yielded per acre, 15 cwt. 80 lbs., while 1 cwt. Bleaching powder, produced 14 cwt. 32 lbs. This, however, was only when the Bleaching powder did not exceed 1 cwt. an acre ; when the quantity was doubled the produce sank to 8 cwt. per acre ; and as the grass was burnt by even the smaller quantity, it is not improbable (and certainly merits enquiry) that half a cwt. per acre would have produced a still better effect.

It was also found that 160 gallons of GAS WATER and 160 lbs. of Gypsum produced, under exactly equal circumstances, as much dry grass as 640 lbs. of pure sulphate of Ammonia ; viz., 1 ton and 2 lbs. in both cases ; a circumstance of some importance when it is borne in mind that the gas water and gypsum cost scarcely a quarter so much as pure sulphate of Ammonia.

At the suggestion of Mr. Edward Solly, the effect upon grass of certain reputed POISONS was made the subject of enquiry ; when it was found that the following substances had rather a beneficial action, viz., strong Nitric acid, at the rate of 10 gallons per acre, strong Muriatic acid at the same rate ; and that Corrosive Subli-

mate, at the rate of 20 gallons of the saturated solution per acre, and Nitromuriatic acid, at the rate of 10 gallons per acre, only lowered the produce to the extent of 1 cwt. 48 lbs. per acre.

It has been found that the appearance of the grass when growing, and its quantity when first cut, are no guides to the actual value of a given manure ; for it appears that in some instances the quantity of mere water contained in the grass is very considerably greater than in others. For example the DRIED produce obtained from grass treated with Muriate of lime was only 1-7 of the original weight ; but Sulphate of soda, Nitrate of potash, Nitrate of soda, in small quantity, and Gas water alone, furnished 1-6 ; and Nitrate of potash, Nitrate of soda, in larger quantity, Gas water mixed with Sulphuric acid, or with Sulphate of iron, or with bleaching powder, gave 1-5 ; while the lime used in purifying gas by the moist way yielded 1-3. So that while 1 ton of fresh grass produced by means of *gas lime* would yield *dry* 6 cwt. 74 lbs., 1 ton from Nitrate of potash, Nitrate of soda, in large quantities, Gas water mixed with Sulphuric acid, or with Sulphate of iron, or with Bleaching powder, give but 4 cwt. ; 1 ton from Sulphate of Soda, Nitrate of potash, Nitrate of soda in small quantities and Gas water alone, give only 3 cwt. 37 lbs. ; while 1 ton from Muriate of lime yields so little as 2 cwt. 96 lbs. or considerably less than half as much as the first.

Among the manures which produced NO EFFECT on this occasion was Woolwich Humus, a substance consisting of ancient decayed vegetable remains found in excavating some docks at Woolwich, Soot, Sulphate of iron, Guano ; while Poittevin's manure, Dutch manure, Clarke's Aimatic compost, Lance's Carbon, and Chatwin's artificial manure all diminished the quantity of dry grass more or less. It does not however follow that they are prejudicial, or even useless ; because Woolwich humus, which in these experiments was of no value, was found in the Kitchen garden a very useful substance. It is possible that the manner of application, a top dressing, or the season, autumn, were unfavourable to their action.

Note by Mr. E. Solly.

It is, I think necessary to observe, that, notwithstanding all the care that was taken in selecting the ground, the turf which formed the subject of the preceding experiments, varied greatly in quality : each experiment was made it is true on a small space of ground, but as the number of experiments was considerable, the space over which the whole series extended was necessarily large ; and included a considerable variety of turf, hence it is impossible to compare the produce of the different squares with the ordinary unmanured grass of the Lawn, as the quantity of the latter is very variable. The produce of the standard square No. 24, was 8 cwt. 64 lbs. dry hay, whilst that of No. 44 which had been manured with 7 cwt. of Bone ash, was only 2 cwt. 98 lbs. dry hay, which is about the quantity which would have been given by a similar square without any manure at this part of the lawn. In the same way, it may be remarked that the superior produce of the strong mineral acids, Nos. 47, 48 and 49 over that of Bone ash, Nos. 44 and 45, is in part due to the difference naturally existing between the soil and turf where the experiment was made.

The experiments with ammoniacal compounds are amongst the most satisfactory, and in those the increase of produce is so large as to be quite independent of variations in the soil, &c. It is rather unfortunate that the strength of Gas liquor varies very greatly, so that the same quantity at one season of the year frequently contains much more ammonia than at others. The Gas liquor used in these experiments was very strong ; every gallon required about 4670 grains of the strongest Sulphuric acid to neutralise the ammonia, and on evaporation left nearly 20 oz. of crystallised Sulphate of ammonia. The Gas liquor commonly employed is much weaker ; some used in the garden the preceding year, required only about 1600 grains of acid per gallon, and gave 7 oz. of the crystallised salt. The object which I had in the experiments 38 to 43, was to ascertain what quantity of Gas liquor produced the maximum effect

which could be advantageously obtained, or rather what was the largest quantity which could be profitably employed as manure. It is evident that this experiment was not carried out quite far enough as the maximum of produce was not obtained. No. 38 to which 240 gallons of Gas liquor, equal to 300 lbs. of Sulphate of ammonia, was applied, produced a far better crop than No. 39 which received 200 gallons or 250 lbs. of the salt: the increase of grass being in a much greater proportion than the increased quantity and cost of the manure. There appears to be little doubt that in situations where Gas liquor can be had readily, and applied without difficulty, it is preferable to Sulphate of ammonia; but on the other hand, the latter, though rather more expensive, can be spread more easily, and is far less costly in carriage.

V. Notes made in the Garden of the Horticultural Society upon the rate of growth by plants at different periods of the day.
By the Vice Secretary.

(Communicated by the GARDEN COMMITTEE.)

THE great differences that occur in nature between the relation of plants to the atmosphere, at different periods of the day, do not appear to have often suggested the necessity of observing the degree in which vegetation is affected by such circumstances in their rate of growth. And yet we must suppose that the development of a plant under the influence of a bright sun, or in a damp and clouded atmosphere, in a cool night, or in a chilly morning before sunrise, will be materially dissimilar. It is in very few cases, however, that physiologists have turned their attention to such variations. For this reason, and more especially because the operations of the forcing gardener are very much connected with the enquiry, a series of observations upon the subject was made four times daily, in the Garden of the Society, by Mr. James Donald, during the months of March and April 1843.

The plants selected for Experiment were a Sweet willow (*Salix pentandra*), a Fig, the Onyx Passionflower, (*Passiflora onychina*), and a Vine. The place in which the observations were made was a damp curvilinear stove, used for the cultivation of tropical plants; its average temperature being 69°; that is 73° by day and 65° by night. The plants were fastened as they grew, to a lath, on which the amount of lengthening was marked off four times a day, viz. at 6 A.M.; Noon; 6 P.M.; and 11 P.M.

Upon the rate of growth by Plants

1. Observations on the elongation of the Sweet Willow (*Salix pentandra*) at different periods of the day and night, in a curvilinear stove—average temperature 69°. (+ = above .40. — = below .05.)

5 Table shewing the general result of the foregoing observations upon the rate of growth of the four plants under examination. Corrected by deducting one-seventh from the first column and adding it to the fourth; in consequence of the period called the Morning in the foregoing tables, and occupying the first column, being too long by one hour, while the Night period, or last column, is proportionably too short: which materially affects the total amount of growth, though too small to be worth notice in the individual observations.

	12 P.M. to 6 A.M. Morning.	6 A.M. to noon. Forenoon.	Noon to 6 P.M. Afternoon.	6 P.M. to 12 P.M. Night.
1. Willow	9.37	+ 11.13	10.42	9.71
2. Fig	4.37	4.88	5.04	+ 5.23
3. Passionflower	18.	13.41	+ 22.44	18.20
4. Vine	+ 18.13	17.24	17.21	16.02
	49.87	46.66	55.11	49.16

It is probable that these returns will strike different persons differently ; and therefore they are printed at length, and not in the form of an abstract. All such observations are affected by so many circumstances, the exact nature of which it is perhaps impossible to estimate, that safe conclusions can only be drawn from the average of a large number of facts. The observations made in the course of these experiments amounted to 908 ; a number sufficiently large to entitle the conclusions that are drawn from them to some attention.

As has been already stated the great object of the enquiry was to ascertain at what period in the 24 hours plants in hot-houses grow the fastest, and at which the slowest. The table No. 5, shews that upon the whole this happens in the Afternoon ; but that there is a near approach to the same rate in the Morning and Night, the growth in the one case being 55.11 inches and in the others 49.87 and 49.16 respectively. When, however, we look to the details of these results we find that each of the four plants has its own period of maximum growth, the Vine preferring the early Morning, the Willow the Forenoon, the Passionflower the Afternoon, and the Fig the Night. In the Passionflower the preference amounted to something considerable ; and in the Vine to as much as two inches in the course of six weeks ; but in the others it was unimportant. It appears however that in the case of the Willow and Vine, that is to say of the two hardiest of the plants under experiment, the principal growth takes place between midnight and noon, notwithstanding that those are the coldest hours in the twenty four.

I have not seen the paper of Harting* on this subject, quoted by Münter in his observations on the growth of plants ; † but if, as

* In the *Tydschrift voor Natuurlyke Geschiedenis en Physiologie*, by van Hoesen and de Vriese.

† *Botanische Zeitung*, Nov. 3, 1843.

the latter author states, his own observations and Hartings are essentially the same, I may be permitted to quote the one as representing the views of the other. Münter says that he found the diminution of light increase the growth of the branches of the Sycamore, the Vine and the Elder. And this is precisely the common opinion. But it will be seen from what has been just stated, that in the four cases now mentioned, and under their peculiar circumstances, that was by no means universally the case, for in the Willow the greatest growth took place between 6 in the Morning and Noon, of the Passionflower between Noon and 6 in the Evening, and it was only in the case of the Vine and Fig that the dark hours gave the greatest amount of extension. It is however to be observed that Münter's experiments were made in the open air, and therefore may not perhaps be quite suited for comparison with those now detailed.

The period when the Willow and Vine grew slowest was the early Morning in the case of the Willow, and before midnight in the Vine: the difference in the Willow being as 9.37 to 11.13 and of the Vine as 16.02 to 18.13. This seems to show the danger of employing a high Night temperature, which must necessarily force such plants into growing fast at a period when nature bids them repose. In the Fig the smallest growth was made in the early Morning, but the rate of growth of that plant does not appear to be materially different at any period of the day; for, in nearly two months, Night, when it grew fastest, had not an advantage over Morning when its growth was slowest, to the extent of much more than $\frac{3}{4}$ an inch. In the Passionflower the fastest growth was in the Afternoon, the next at Night, and the smallest in the Forenoon, in which respects it is at variance with all the others.

Table 5 also seems to indicate the existence of some regular alternation of growth, from fast to slow; the morning growth of 49.87 diminishing at the next period to 46.66, then rising to 55.11, and then falling to 49.16, which again rises to 49.87; and it is not im-

probable that something of this kind takes place in nature: a period of vigorous developement, requiring a great expenditure of vital energy, being followed by comparative torpor till the vital powers are recruited. For example the successive growths of the Willow are represented by the numbers 10, 26, 20, 20, 25, 26, 26, 10, 42, 31, 45, 17, 19, 40, 18; of the Fig, whose general slow progress is unfavourable to this kind of observation, by 12, 22, 21, 03, 11, 11, 16, 15, and 11, 14, 11, 03, 22, 13, 13, 04; of the Passionflower by 20, 11, 60, 05, 14, 03, 20, 47, 17, 17, 22 and 26, 16, 76, 33, 40, 50, 29, 29, 34, 24, 50, 35; and of the Vine by 20, 34, 12, 32, 55, 31, 31, 37, 62, 54, 28, 52, 74, 50, 14, 22, 38; and so on. Although this kind of oscillation is not absolutely constant, yet it is so very usual, as to appear to be a part of the customary habit of vegetation; and is yet more striking if we turn to the instances of most rapid growth in the four cases before us; for they are invariably succeeded by a corresponding decrease of growth. For example the willow occasionally lengthened as much as four tenths or even more than five tenths of an inch in six hours; these were invariably succeeded by a considerable reduction in growth; thus .42 sunk to .31, .45 to .17, .40 to .18, .40 to .17, and .43 to .20. The maximum of developement in the Fig was rather more than two tenths of an inch in 6 hours; when this or any similar rate was observed the numbers stood thus; .22 fell to .13, .19 to .15, .20 to .10. In the Passionflower the greatest growth was rather more than eight tenths of an inch in six hours; here .82 fell to .10, .79 to .34, .70 to .27. And finally the Vine, which on one occasion grew nearly nine tenths of an inch in six hours, is found to obey the same apparent law; for .89 is followed by .63, .70 by .47, .74 by .50, .71 by .30, and so on.

Another subject of consideration is the cause or causes that tend to produce the fastest and the slowest growth. Fluctuations of temperature can hardly have had any connection with this, because the plants were grown, as has been stated, in a hothouse, the heat of which was maintained at about 73° by day and 65° by night.

Doubtless the plants under experiment were to some small extent affected by variations between these degrees, but 65 is always too high to allow of any serious impediment to vegetation, nor do I perceive any apparent connection between fast and slow growth, and the temperature of the external air. For instance the slowest growth of the Willow took place with the external temperature at 50°, when it lengthened only .03, while with the external air at 34° it grew on another occasion as much as .56; the slowest growth of the Fig was .00 with the external air 54°, and its fastest was .22 with the external air 34; the minimum growth of the Passionflower was .03, the external air being on one occasion 48° and another 35°, but when it was 41° the Passionflower grew .70; and so of the Vine: when the external air was 44° it only grew .04, but when it was 40° it grew as much as .85. This evidence proves I think conclusively that in the cases under experiment the temperature of the external air in no way affected the rate of growth.

The next question that arises is whether the amount of light can be supposed to have produced any influence. If we compare the degree of light under which the more remarkable growths were made, and which are marked + and — in the tables, we shall find the following result

FAST GROWTH.	Cloudy or Foggy.	Clear.
1. Willow, 7 cases	5	2
2. Fig, 15 cases	5	10
3. Passionflower, 5 cases	3	2
4. Vine, 10 cases	7	3

SLOW GROWTH.	Cloudy or Foggy.	Clear.
1. Willow, 14 cases	9	5
2. Fig, 41 cases	18	23
3. Passionflower, 15 cases	8	7
4. Vine, 3 cases	0	3

If we are to judge from the comparison of some of these extreme cases, we should infer that plants grew fastest in cloudy weather, under the influence of diminished light, and slowest in clear bright weather, when light is abundant, as seems to be the opinion of Münter above quoted. Thus in the Vine, out of 10

cases of unusually rapid growth 7 took place in cloudy weather, and only 3 in clear weather; in the Willow, out of 7 such extremes 5 were in cloudy and only 2 in clear weather; and in the Passionflower 3 extremely fast growths took place in cloudy and 2 in clear weather. The Fig is however altogether an exception to this supposed rule, for in 10 out 15 extreme cases it grew fastest under bright light. Possibly this discrepancy may be accounted for by the different nature of the plants under experiment. The Willow, Passionflower and Vine are plants with a very thin skin, and therefore will suffer considerable loss of their fluids, by evaporation under bright light, which must obstruct their growth; the Fig on the other hand, being a plant with a peculiarly thick skin, will suffer much less from this cause, and may indeed demand a much larger supply of light than the others in order to perform its functions in the most efficient way.

But if the experiments were to a certain degree to confirm the general opinion that plants grow fastest in warm cloudy weather, it is also clear that they indicate the presence of other agencies than light and heat, and a regular supply of moisture. The numerous exceptions that are found even in those plants which in rapid growth conform the best to the supposed rule show this sufficiently well, and when we attempt to reduce to it the slowest growths we fail entirely; the facts inclining sometimes one way and sometimes the other.

One of the most singular facts brought out by these observations is the total want of correspondence between the effects produced upon plants by the same external circumstances. The subjects of experiment were placed within a few feet of each other, in a house heated very uniformly, and equally exposed to light, and to every other agent by which it is conceivable that plants should be affected. Yet strange to say, it appears certain that the same causes do not produce the same results when operating upon plants of different species. For example the greatest growth made by

the Sweet Willow was on the 7th of March, when the noon day observation gave .56 ; at that hour the growth of the Fig had been only .08 and of the Passionflower .24, which was about the average ; and of the Vine only .42 which was slightly above it. The greatest growth of the Passionflower was on the 14th of April, when the 6 P.M. observation gave .82 which was .42 above the average ; on the same day the Willow had grown .36, or .20 above the average ; the Fig .09, or about the average ; and the Vine, .14 or .24 *below the average* ! If we turn to the instances of impeded vegetation we shall perceive just the same conflicting results. The slowest growth of the Vine was on the 10th of April when the Noon day observation amounted to only .04 to .34 below the average ; at that time the Passionflower had grown .34 or .11 above the average ; the Fig .03 or .5 below the average ; and the Willow .14 or only .2 below its average elongation at that hour.

Upon the whole then it seems that we must regard the growth of plants as a far more complicated problem than is generally supposed. The evidence that has been produced appears to show that there is a regular oscillation of growth during the 24 hours, that the principal developement takes place in the afternoon, (between noon and 6 in the evening), and follows the smallest which occurs in the Forenoon (between 6 in the Morning and noon) ; and that this oscillation is not connected with light and temperature, because the growth in the Forenoon is less than in the Morning (11 P.M. to 6 A.M.) when the temperature is at its lowest ; it may also be inferred that thin-skinned plants grow fastest in the absence of bright light, and possibly that thick-skinned plants obey an opposite law.

But it does not appear satisfactorily that the varying rates of elongation are, under the circumstances of the experiments now detailed, dependent, to any considerable extent, upon fluctuations of temperature, light, or moisture. On the contrary it seems almost certain that some other powerful agent is in operation, the nature of which we have at present no means of ascertaining.

VI. *Notes of a Visit to Mexico, Guatemala, and Equatorial America, during the Years 1836 to 1843, in search of Plants and Seeds for the Horticultural Society of London. By Mr. THEODORE HARTWEG.*

AFTER a voyage of fifty-eight days I arrived, on the third of December, 1836, at Vera Cruz; and immediately, after landing my luggage, I took advantage of the offer of Mr. De Wilde, a partner in the house of Messrs. Stallforth and Co., to proceed to the farm of Mr. Lavater, a gentleman to whom I had letters of introduction. Two days' riding, over a country without regular roads and through ravines, brought me to Zaquapan, the name of this gentleman's residence.

For three leagues, from Vera Cruz to Santa Fé, the road lay over a sandy plain by the seaside, covered partly by *Convolvulus maritimus*, a large round-leaved *Opuntia*, a *Croton*, and, above all, by *Mimosa pudica*. At Santa Fé the vegetation became more luxuriant, and the small shrubs were replaced by stately *Palms*, *Acacias*, several *Scitamineous* plants, and various *climbers*. However, being anxious to quit the lowlands, which so often prove fatal to new comers, I did not particularly examine them.

ZAQUAPAN is placed at an elevation of about 3,000 feet above the level of the sea, on the eastern declivity of the snow-clad Orizaba, which attains the height of more than 17,000 feet; the climate is temperate and the place surrounded with the richest vegetation I ever saw in Mexico. Upon leaving the savannahs, which are covered with a scanty undergrowth, I entered a forest of *Oaks*, (*Quercus jalapensis*, H.B.K.) and there a change took place as if brought on by magic; *Orchidaceæ*, for which I had been on the look out since I left Vera Cruz, and of the finding of which I had

given up all hope, considering the elevation I had attained, appeared here in the greatest abundance ; the oaks actually seemed to groan under their weight ; *Maxillaria densa* and *tenuifolia*, forming festoons and hanging gracefully over the branches they were growing on, seemed to strive with the larger species of *Tillandsia* for their existence. It was here I met with the beautiful and new *Cyrtorchilum maculatum*, and the varieties of it now become so common. In the ravines or rocks I found *Maxillaria aromatica*, *Epidendrum seriatum*, *equitans*, *umbellatum*, *fuscatum*, *cochleatum* (this latter with nearly all its varieties), and *Acropera Loddigesii*. In the more exposed situations, particularly on trees overhanging the perpendicular sides of the ravines, *Stelis ciliaris*, *Dinema polybulbon*, *Isochilus linearis*, *Polystachya luteola*, and the little plant that now bears my name (*Hartwegia purpurea*) were common. The first plant of *Brassavola glauca* I met with was on a *Coccoloba*, in a wood descending to the savannah ; but I afterwards found it on oaks in abundance near this station. To grow this plant, as well as *Hartwegia purpurea*, to perfection, I would recommend a temperature of 65-70° of Fahr., and to be kept in the driest part of the stove. The same treatment may be applied to the thick-leaved *Epidendrums* and *Oncidiums*. Near the same locality I found *Berberis tenuifolia*, forming a shrub 10 to 12 feet high, and at the time covered with its black berries on spikes more than a foot in length. In the more open places, among grass, the *Cebadilla*, or *Asagræa officinalis* was ripening its seeds on a stem four feet high ; the roots, leaves, and particularly the seeds of this plant are used by the muleteers, in a state of fine powder, for killing the maggots in the wounds of their beasts, and occasionally an infusion of it is used in extirpating certain vermin which may be found on the heads of the lower class ; but its employment is not so general as the occasion for it. The seeds of the *Cebadilla* form an article of export in Vera Cruz ; but judging from its low price (six shillings for 25 lbs.) it seems to be in little demand, and scarcely pays the

gathering. The soap plant, *Agave saponaria*, was found in the same locality, throwing up its flower-stem like a tuberose to which in fact it bears much resemblance. Its thick fleshy root crushed is a good substitute for soap, and is abundantly used by those who are too poor to buy that article. This, as well as the *Cebadilla*, appears to be common in the temperate parts of Mexico, having been found in several places, even as far south as Guatemala.

The 27th of December found me on the road to Jalapa, where I arrived on the following day. Being anxious to come to my journey's end, I took the diligence for Mexico; and thence, after delivering various letters of introduction and procuring new ones, I again proceeded to Guanajuato, the place of my destination. Upon my arrival I presented my letters of introduction to Mr. Stanley, Mr. Shoolbred, and Mr. George O'Gorman. The latter gentleman being about to proceed to Silao, a place distant seven leagues, I accepted an invitation to spend a week with him, but it being then the middle of the dry season, my exertions did not prove very successful; and upon my return, the necessary arrangements having been completed, I left for the more elevated parts of that mountainous district, which I hoped to find more likely to fulfil the object of my mission.

My first excursion was to the GIGANTE, the highest point of the range of mountains of Guanajuato, where I was rewarded with *Garrya obovata*, then in flower, forming a shrub six feet high; I afterwards found it more commonly on the Bufa, a bluff rock a league from Guanajuato, but all my efforts to procure seeds were only rewarded with a single grain, which I now find did not germinate. *Arctostaphylos pungens* has also been found in these stations, both in flower and fruit. *Berberis fascicularis* forming a shrub 8 to 10 feet high, was covered with flowers, as well as *Ribes campanulatum*. In another excursion I found, both in flower and fruit, a second species of *Garrya* (*G. laurifolia*), forming an evergreen shrub 12 to 15 feet high, with the *Madroño*, or *Arbutus densiflora*, forming a

shrub, or small tree, covered with delicate white flowers. In the more sheltered situations, in the ravines near the town, *Clematis pubescens* was in full flower. *Oaks*, which cover the greater part of the mountains, were in great variety, but the acorns of the preceding year being all dead, I could procure neither seeds nor specimens. *Pines* were nowhere to be met with.

On the 13th of April I arrived in LEON from Guanajuato, but after two months' disappointment on the then parched up plains and mountains, from which I often returned without having found a single seed or specimen for the herbarium, I often longed for the green woods on the declivity of Orizaba, where vegetation never seems at rest. The only things worthy of notice from this station were *Ipomæa longifolia* and *Lælia majalis*; the latter species I found at an elevation of about 8,000 feet, growing on oaks, and producing such a profusion of large pink flowers in May, that even the Mexicans find it attractive, and stick a few plants on the Limes, (*Citrus medica*) growing before their houses. Of this I sent an abundant supply of plants, but as it has resisted all attempts at cultivation, I would recommend it to be kept in the driest part of the stove, and to be liberally supplied with water during the summer months only. In fields *Lupinus Hartwegii* was common; this seems to be quite stationary, having nowhere else been met with.

On the 17th of June I arrived at LAGOS, where I found the same barrenness during the dry season as at Leon; and after a month's fruitless wandering, I left, on the 13th of July, for Aguas Calientes. Of the more interesting plants found near Lagos, I may mention *Milla biflora*, bearing from one to six of its star-like white flowers on one scape; *Bessera elegans* (*Caloprasum Geroltianum* of *Schiede*), the bruised leaves of which, mixed with a little water, are used occasionally for killing flies; *Zephyranthes sessilis*; *Sprekelia glauca*; and *Habranthus concolor*; the three latter flowering before the leaves appear.

At AGUAS CALIENTES I found a little more occupation, the rains having then set in; but being still dissatisfied with my excursions, I determined at once to leave the high table land and proceed to Bolaños, where I should have the command of a vegetation from 3,000 to more than 8,000 feet of elevation. The town of Bolaños, where I arrived on the 4th of October, is situated in a deep ravine, about 3,000 feet above the level of the sea, and from its confined situation has a higher temperature than might be supposed. The thermometer ranges from 39° to 85° Fahr. in the month of December, but in May it is from 85° to 95° Fahr., and even as high as 102° in the shade. The atmosphere being very dry is favourable to the growth of *Bromeliaceous* and *Cactaceous* plants, of which latter there is a great variety, especially among *Opuntias* and *Cerei*. Of the latter there are species which rise to the height of 30 or 40 feet, and yield an agreeable fruit of the size of a large walnut, with red or yellow pulp; they are known under the name of *Pitaya*. Here also occurred a species of *Agave* with leaves six feet long by four inches broad, from which a spirit is distilled known under the name of *Vino Mescal*. When the plants are of a certain size they are taken up, and the stem, which is about 18 inches long, as well as the leaves, is cut off to the base, which gives the trunk a globular appearance. In this state it is roasted, then crushed, and after passing into the vinous fermentation, *Vino Mescal* is distilled from it. This spirit may be compared to weak whiskey, but its strong smoky flavour renders it anything but pleasant. The plant I never could see in flower.

Ascending the steep sides of the ravine on the western side, I left the region of *Acacias*, *Bromeliaceæ* and *arborescent Cerei*, and entered that of *Oaks*. After a four leagues' ride, and constant ascent, I arrived at BERBEREA, the Mining Company's wood cutting establishment, situate in the midst of woods at an elevation of more than 8,000 feet above the level of the sea. Here I found, surrounded by evergreen *Oaks*, *Pines* and *Arbutus densiflora*, the

showy *Befaria mexicana*, forming a shrub of about eight feet high, and at the time covered with its large white flowers.* The pretty little *Mammillaria senilis* I found on rocks in the more exposed situations; its long white spines which at the points are bent backwards seem to defend it against frost. In the more open places *Lupinus leptocarpus*, *Pentstemon imberbis*, *Lamourouxia longiflora* and *multifida* were common.

On the 10th of January 1838, I left Bolaños in company with Mr. Floresi the chief commissioner of the Bolaños mines, after having been most hospitably treated by him as well as by Mr. Watson, the company's accountant. On the 14th of that month, I arrived at ZACATECAS, whither my collections from Aguas Calientes and Bolaños had preceded me. The sterility of the mountains and plains about Zacatecas, at this season, was such that I was spared the trouble of making fruitless excursions; I, therefore, arranged my dried specimens and despatched them along with the seeds and bulbs to England. The species collected during the first year amount to 227, of which the following have flowered, or exist in the Garden.

Catasetum maculatum	Maxillaria variabilis
— citrinum	— — var. unipunctata
Epidendrum asperum	Cyrtochilum maculatum
— equitans	— — var.
— umbellatum	Stelis ciliaris
— fuscum	Polystachya luteola
Isochilus linearis	Dinema polybulbon
Trichopilia tortilis	Asagræa officinalis
Hartwegia purpurea	Ferraria sp.
Oncidium stramineum	Agave saponaria
— sphacelatum	Habranthus concolor
Lælia anceps	Allium striatellum
— furfuracea	Sisyrinchium sp.
— majalis	Milla biflora
Notylia punctata	Zephyranthes sessilis
Acropera Loddigesii	Bessera elegans
Brassavola glauca	Sprekelia glauca
Liparis elata	Bouvardia splendens
Maxillaria aromatica	Quercus jalapensis
— tenuifolia	Crotalaria sp.

* A large parcel of seeds which I transmitted to the Society having failed to grow, this gem of the Mexican highlands remains still to be imported.

Solanum sp.
 Lupinus Hartwegii
 — leptocarpus
 Anemopsis californica
 Cuphea sp.
 Heliotropium curassavicum
 Verbena incana
 Parkinsonia aculeata
 Malvacea
 Prosopis dulcis

Onagracea
 Trifolium involucreatum
 Mimosea
 Ipomæa rubrocærulea
 — Horsfallii
 — longifolia
 Convolvulus 3 species
 Berberis tenuifolia
 Mimosa filicina.

On the 26th of February, 1838, I proceeded from Zacatecas over the high table land to SAN LUIS POTOSI and thence to the Rancho de los Gallitos. Near San Luis Potosi I found *Berberis trifoliata* in great abundance, forming a shrub 4 to 5 feet high; it was then just coming into flower, and all my efforts to find seeds were useless; but I afterwards received a large supply through the kindness of the bailiff of the Hacienda del Espiritu Santo, and it has since been abundantly raised and distributed at the Garden. The Rancho de los Gallitos, being situate on the eastern declivity of the great table land, in a narrow valley, enjoys a delightful temperature, and is surrounded by constant verdure and noble forests of *Oaks*. It was near this station I found the striking *Berberis Hartwegii* with its long spikes of flowers and pinnate leaves. This desirable species still remaining to be imported, I shall describe its locality particularly, for its seeds will amply remunerate any traveller that may land at Tampico and proceed to San Luis Potosi or Zacatecas. Before reaching the valley of Los Gallitos, on the ascent from Santa Barbara, there is a bluff rock on the right hand side of the road, called "El Contadero," with a small chapel hewn in the rock, and always gaily adorned with flowers and candles by the passers by; this place is held in the deepest reverence by the Indians, from the circumstance of Nuestra Señora de Guadalupe being said to have appeared to several of them, and they cannot pass this place without paying homage to their protectress saint. It was at the foot of this rock that I found *Berberis Hartwegii*.

After exhausting the resources of the last station and despatching my collections to Tampico I returned to ZACATECAS, where I

expected to have found some *Pine seeds* which had been promised me by the Company's forester at Bolaños; but not receiving any, I went there myself without loss of time, and found to my great regret, that the cones had all shed their seeds. I then joined a convoy for Guadalajara whence I returned to Bolaños and Zacatecas, with scarcely an acquisition to remunerate me for that long journey.

Having now received permission to proceed in the direction I thought most proper, always, however, visiting the more elevated parts, because they were most likely to furnish plants that will endure the open air in England, I resolved to leave the arid plains in the north, and proceed to MORELIA the capital of the State of Mechoacan. The country about this town, from its broken surface, presents a beautiful vegetation; in the higher parts *Pines* and *Oaks* grow intermixed, and the latter are adorned with a great variety of *Epiphytes*. On the western declivity towards the active volcano Jorullo, I found *Pinus oocarpa* in great abundance, forming a tree 40 to 50 feet high; of this I secured an ample supply of seeds, but from its low situation, I fear it will not be proof against our northern winters. The cones of this pine after being ripe will remain on the tree without opening for two or three years, and the seeds in them are equally as sound as the fresh ones. In the more elevated parts I found the showy *Fuchsia fulgens*, in the greatest perfection, and beside it *Rigidella flammea*, bearing its bright scarlet flowers on a scape 3 to 4 feet high. In the more shaded places the pretty little *Hydrotaenia meleagris* and *Arisæma macrospatha* were met with. In pastures, *Bravoa geminiflora* and *Cyclobothra barbata* were common.

After a two months' stay in this interesting country I left for AN-GANGUEO, at which place I arrived after a two days' ride over a mountain road, where I observed fine trees of *Pinus leiophylla* and *pseudostrobus*, the former being called "*Ocote chino*" because, from its abundance of resin, it yields the best "*Ocote*" or candlewood; it

attains the height of 100 feet, and is often 4 feet in diameter. *P. pseudostrobus* also grows in the same situation, and may be easily distinguished at a distance by its long slender branches diverging at a right angle from the main stem, as in the species of the section *Strobus*; its chief range is about 8,000 feet, while that of *P. leiophylla* is a few hundred feet lower. On an excursion to the "Campanario" the highest point of the mountains of Angangueo, I saw some remarkably fine trees of the "Oyamel" or *Abies religiosa*, 5 to 6 feet in diameter and rising to the height of 150 feet. Its chief range is about 9000 feet above the sea; beyond that elevation its place is supplied by *Pinus Hartwegii* rising to the height of 40 to 50 feet. With the latter I found *Veratrum frigidum*, the leaves of which are poisonous to cattle, *Microstylis macrostachya* and *Juniperus mexicana*, the latter forming a small straggling shrub three feet high.*

On the 30th of October, 1838, I arrived at REAL DEL MONTE, after having crossed once more the high table land of Mexico, but as usual without finding much to reward me. The town of Real del Monte, being situated at an elevation of above 8,000 feet, is surrounded by high ground, of which the "Sumate," the highest peak, rises to the height of 9,500 feet above the level of the sea, the country around being well wooded with a great variety of *Oaks* and *Pines*. On the eastern declivity of the Real del Monte chain of mountains is the deep ravine of Mestitlan, commonly called "Barranca grande," which from its chalky soil is a favourite haunt for *Cactaceæ*. It is the only habitat of *Cereus senilis*, that I am acquainted with in Mexico, the largest plants of which, attaining a height of 24 feet, give the scenery a very singular appearance. On another excursion to the natural bridge called "Puente de Dios" I found *Spiræa parvifolia*, *Quercus petiolaris*, *Lindleya mespiloides*, the latter forming a slender shrub 10 to 12 feet high, and the pretty little *Mammillaria Schiedeana* which seems quite stationary there, having no where else been met with.

* The articles collected about Angangueo, consisting of seventeen sorts of seeds, seven kinds of bulbs and roots, and three species of Epiphytes never reached England.

On the barren hills of ZIMAPAN, *Pinus Llaveana*, forming a tree 15 feet high, was at this time (November) covered with small green cones, which are two years in coming to maturity; *Berberis gracilis*, with its slender stem and red leaf-stalks, and *Berberis pallida* have been found at this station, as well as near the hot springs of Atotonilco el grande. In the ravine of Encarnación I found another new species of *Garrya*, *G. macrophylla*, which from its large foliage is by far the handsomest kind; but unfortunately the few seeds I found did not grow. *Juglans nigra* was found in the same locality. Near the Company's farm of "Guajolote" I found several sorts of *pinus*, among which *P. patula*, from its smooth slender stem and valuable timber, particularly attracted my attention. Near the small village of Apulco I found *Berberis lanceolata* and *Pinus apulcensis*, and along the road *Cupressus thurifera* forms a stately tree 120 feet high. From this latter station the descent was very rapid to a place called "El Banco," probably so named in allusion to the bank or ledge of rock over which one has to pass at the imminent risk of falling into the ravine below, in order to reach the small village of San Cornelio. The descent to this place is very interesting; at every step there is some change, the noble *Tree fern* (*Cyathea mexicana*) makes its appearance there; *Lopezia lineata*, *Alstonia ciliata*, *Lophospermum scandens*, *Cobæa stipularis*, *Gaultheria nitida*, were all in full flower. It was in company with those that I found the noble *Habrothamnus fasciculatus* of *Schlechtendahl*, the seeds of which I was unable to procure; it was a very fine shrub about five feet high. It has since been raised in Belgium, and a fresh specimen in flower, communicated by Mr. VAN HOUTTE, Nurseryman of Ghent, has furnished with the assistance of one of my dried specimens the means of preparing the accompanying figure of one of the gayest plants of the Mexican Flora.

By the end of January, 1839, instructions reached me to proceed to Guatemala. I, therefore despatched the collection formed at

Real del Monte, and proceeded again to Angangueo, where by that time I found the pine cones, which I left ripening on my first visit, in a fit state for transmission; on the 20th of February I reached the city of Mexico.

The articles collected in 1838 amount to 307, of which the following have flowered or been raised at the Garden.

Oncidium reflexum, large var.	Carya olivæformis
— sanguineum	Philadelphus mexicanus
Lælia autumnalis	Cornus grandis
— furfuracea	Fuchsia fulgens
Stanhopea venusta	Valeriana Napus
Agave sp.	Convolvulus, two species
Yucca sp.	Ipomæa batatoides
Veratrum graminifolium	Calonyction speciosum
Hydrotænia meleagris	Garrya laurifolia
Rigidella flammea	Lycium macrophyllum
Bravoa geminiflora	Myrsinacea
Arisæma macrospatha	? Freziera sp.
Hymenocallis Harrisiana	Juniperus flaccida
Dioscorea multinervis	— tetragona
Berberis trifoliata	Cupressus thurifera
— pallida	Abies religiosa
Litsæa glaucescens	Pinus Russelliana
Rhamnus umbellatus	— Devoniana
Cistus glomeratus	— Montezumæ
Bouvardia splendens	— Teocote
Melastomacea	— oocarpa
Carduus sp.	— macrophylla
Scleröon oleinum	— Hartwegii
Russellia sp.	— apulcensis
Quercus petiolaris	— pseudostrobus
Rhus sp.	— Llaveana
Lopezia lineata	— patula
Sophora secundiflora	— — var.
Lupinus vaginatus	— leiophylla
Acacia sp.	Mammillaria pycnacantha
Mimosa sp.	— uncinata
Dalea odorata	— fulvispina
Salvia sp.	— aciculata
— Regla	— auriceps
— tubifera	— fuscata
Arctostaphylos pungens	— macrothele
Cobæa stipularis	— horripila
Celtis canescens	— villifera
Alnus jorullensis	— cirrhifera
Spiræa fissa	— longimamma
Cotoneaster denticulata	— bicolor
Cratægus mexicana	— quadrispina
Lindleya mespiloides	— crocidata
Rollinia 2 sp.	— Schiedeana

Mammillaria gracilis	Cereus sessilis
— tenuis	— polylophus
— Wildiana and 22 species not named.	— Deppii
Echinocactus obvallatus	— pulcherrimus
— coptonogonus	Opuntia sessilis
— cornigerus and five sorts not named.	— geometrizans

Upon my arrival in the city of Mexico (Feb. 20. 1839) I lost no time in making the necessary inquiries respecting the best way of proceeding on my new mission to Guatemala, distant nearly twelve hundred miles. After considering how circuitous is the route by sea, I resolved to undertake the journey by land, anticipating that, by going over such an extensive country, I must fall in with some novelties. Having completed the necessary arrangements for such a journey, and procured some letters of introduction to persons in Central America, I gladly accepted a kind offer made to me by Robert Smith, Esq. of OAXACA, to accompany him and his convoy to that place, which we safely reached after a journey of eighteen days.

The valley of OAXACA is between 4000 and 5000 feet above the level of the sea. The greater part being under cultivation, I resolved to visit the well-wooded heights to the east, which are visible from the town. A ride of five miles over a well cultivated country, varied by a few patches of sugar cane and cochineal plantations, brought me to the entrance of the mountains, which are thinly covered with *Oaks* of a dwarfish growth, intermingled with *Arbutus jalapensis* and *oaxacana*. *Cratægus mexicana*, *Alnus mexicana*, *Maurandya antirrhiniflora*, and a species of *Salix* grew along the rivulet. About 500 feet higher at a hut called the Rancho del Estudiante, *Pinus Teocote* and *Leiophylla* appeared, in company with *Cercocarpus Fothergilloides*, and *Tilia mexicana*, the latter forming a lofty tree. In shaded places overhanging the rivulet, *Fuchsia arborescens*, was flowering profusely, forming a little tree 12 feet high with a stem five inches in diameter; a shrubby *Bocconia* and *Garrya laurifolia* were also met with. At the

“ Rancho del ojo de agua,” the ascent became more steep, the *Oaks* appearing in larger masses and taller trees, and covered with several species of *Tillandsia* and a few *Orchidaceæ*.

Having reached the “ CUMBRE ” or highest point, there were some stragglers of *Pinus Russelliana* or *Devoniana*, which in want of cones I could not distinguish, and some stately trees of *Abies religiosa*. The *oaks* were no longer clothed with *Tillandsias* and *Orchidaceæ*, but their places were occupied by a brown moss hanging gracefully down the branches in threads nearly three feet long, which gives the trees a singular appearance. *Cornus disciflora*, *Ceanothus azureus*, *Rubus trilobus* with its large white flowers, the pretty little *Cuphea pubiflora* and *Melampodium montanum* were found at that station, the elevation of which above the level of the sea, must at least be 8,500 feet. In descending gradually towards “ La Parada ” which is a kind of inn, the woods consist chiefly of *Pinus Teocote* and *Oaks*. On the latter I found *Odontoglossum nebulosum*, *Cattleya citrina* and several other species. After passing the bridge, “ Puente de Gia,” where I found *Echeveria acutifolia*, and the village of San Juan, the *Oaks* ceased entirely, and were replaced by small *Acacias* and *Bromeliaceæ*. *Orchidaceæ*, although few in number, no longer cling to trees, but seek their nourishment from the ground; an instance of which is *Epidendrum falcatum* with its thick leaves and brittle rhizoma, which was growing most luxuriantly on a heap of loose stones and perfuming the air towards evening with its large white flowers. After descending from the village of San Juan to the Hacienda of Santa Ana, and following the rivulet as far as the mine of Socorro, I crossed a high ridge, where mining operations are carried on, and arrived at the Hacienda del Carmen, an establishment for reducing the silver ore. Carmen, or Castresana as it had formerly been called, is situate in a deep and narrow ravine, the sides of which are well wooded with *Pines* and *Oaks*, the showy *Arctostaphylos nitida*, *Gaultheria hirtiflora*, *Vaccinium brachys-*

tachyum, *Arbutus jalapensis*, *Lyonia ferruginea* and *Philadelphus mexicanus*. Ascending the steep sides on the right I arrived on the "Monte Pelado" or bald mountain, so called from the upper part being destitute of trees, which gives it a singular appearance compared with the mountain ranges on the opposite side of the ravine. Near "Las Cruces" on the ascent to the Monte Pelado I observed some remarkably fine trees of *Abies religiosa* and *Pinus Ayacahuite*, the latter measuring three to four feet in diameter. Bordering on the limits of trees I found three plants, remarkable for their geographical distribution; they had previously been known from other countries; they are *Chimaphila maculata*, *Pyrola rotundifolia* and *Ottoa ænanthoides*, the latter found by Humboldt near Ibarra in the Andes of Quito.

Having well examined the vegetation about Carmen, I ascended the high ground at the back, crossed LLANO VERDE and arrived at the Indian village of Tanetze. The name of Llano verde (green plain) is given to the mountain intervening as far Tanetze, a distance of eighteen miles, and is derived from a green swampy place in the midst of the wood, measuring some twenty feet square. The climate of Llano verde is termed by the natives "caliente humida," or warm and damp, the temperature being about 70° Fahr. and particularly adapted to the growth of *Oncidium ornithorhynchum*, which I found there in great splendour. In the more elevated parts *Pinus apulcensis*, *Tilia mexicana*, *Clethra mexicana*, several *Lycopodiums*, *Pteris aquilina* twelve feet high, and *Cyathea mexicana* were met with. Descending this ridge, several *Melastomaceæ*, *Epidendrum rhizophorum* with its bright scarlet flowers, were growing on the outskirts of the wood. From Tanetze I went over a broken road to Tabaa where I found *Befaria lævis* and *discolor* in full flower, growing in company with *Magnolia glauca*, the flowers of which are used by the religious Indians in decorating their places of worship. Tabaa, being situate in "tierra caliente," or the warm country, produces some fine *Pine apples*, *Oranges*, *Plantains*, *Sugar-*

cane, Cherimoyers and Coffee. Descending towards Santa Gertrudes I found a small bean, the seeds of which resemble those of *Abrus precatorius*, and are said to be employed with success against the bite of the little venomous spider called Chiatatlahua.

Passing over the steep ascent of the CUESTA DE MATA HOMBRE I found some *Orchidaceæ* which had previously been seen near Tabaa; the woods consisted of a variety of *Pines* and *Oaks*. Descending towards the river Tabaa luxuriant vegetation gradually disappears, and the arid soil only produces stunted *Mimosas, Agaves, tall Cerei*, and a few straggling specimens of *Cyrtopodium punctatum*. The same vegetation continues ascending the other side towards Villa-alta. From the latter place to Tonagua, the road leads through many ravines, and the vegetation is similar to that of Tabaa. The inkplant, "Xuquilite," *Justicia atramentaria*, was pointed out to me here as a great curiosity. To produce the ink the foliage and young shoots are enveloped in large leaves, such as those of Plantains, and are gently heated over the fire for a few minutes, after which a black fluid is expressed from them, and used instead of ink. Its chief use with the Indians, near whose houses some plants are generally to be met with, is in a diluted state, to give their linen a blueish appearance. I never found the plant wild; in its cultivated state it forms a compact erect shrub three feet high.

Towards COMALTEPEQUE, species of *Arum, Pothos, and Heliconia*, indicating a true tropical climate, make their appearance, the *Mammee* trees are covered with a variety of *Orchidaceæ* and *Tillandsias*, and, such is the fertility of the soil, assisted by a constant heavy dew and mist, that three crops of Indian corn are obtained on the same piece of ground in one year.

Between Comaltepeque and CHOAPAN the mountains are partly destitute of trees; woods of *deciduous Oaks* still occur, and trees of *Pinus oocarpa* which latter seems to enjoy a high temperature.

Near ROABELA, pine apples were growing wild along the road;

the fruit they produced was small and worthless, but was said to improve much when cultivated.

At YALAHUI the vegetation is most luxuriant; *Pines* cease to grow, but the higher parts are still covered with *deciduous Oaks*. Here the Cordillera, which had been entered at a distance of two leagues from Oaxaca, is passed; the whole distance being about fifty leagues. Towards IOCHIAPAM the "bajos," or lowlands, bordering on the gulf of Mexico begin, *Palms* become more frequent, and the first *Cotton* plantations occur.

At PLAYA VICENTE *Palms* covered large spaces of ground; and the thermometer stood at 2 P.M. at 94° Fahr.

At the RANCHERIA DE BUENA VISTA the *Oaks* composing forests are small, vegetation assumes a dry aspect, and the large tracts of savannahs were parched up. Towards the SANTUARIO *Cotton* plantations became more frequent, and three species of *Palm* were observed. The temperature of the lowlands was 95° in the shade during the day, and 83° at night. From this place which is one hundred leagues from Oaxaca, I returned by the same road as far as Comaltepeque.

From the latter place to TOTONTEPEQUE the vegetation bears a great similarity to that of Tonagua, from which it is separated by a high ridge. In the more elevated parts the Amber tree, *Liquidambar styraciflua*, forms a large tree and its secretion is highly valued by the Indians in dressing wounds. The village of Totontepeque is about 4,000 feet above the level of the sea, and enjoys a temperature of 65° to 75° all the year round; the climate is particularly well adapted to the growth of *Coffee* of which there are some patches; the Granadilla (*Passiflora stipularis*) is very common, as also the "Aguacate" or *Alligator pear*, a species of *Persea*, with a large globular fruit and thick rind.

From Comaltepeque the road for nearly eight leagues rises continually until it reaches its highest point, the "cumbre" or summit of Totontepeque, which by several barometrical observations

is determined to be between 9,000 and 10,000 feet above the level of the sea; the temperature on the 13th of May at two o'clock P.M. was 58° Fahr. The deep vallies and ravines surrounding this mountain no doubt contribute in a great measure to heighten the temperature, which in combination with the heavy dews and mists, produces a most luxuriant vegetation, which, under ordinary circumstances, could not be expected at such an elevation. The whole mountain, up to the summit, is covered with large *evergreen Oaks* and other forest trees, and their branches were loaded with a variety of *Tillandsia* and *Cereus Ackermanni*, the latter in full bloom, vying in richness of colour with *Epidendrum vitellinum*. The first flowers I saw of that rare and magnificent *Epidendrum* were at such an elevation on the trees that I was unable to recognize what they were, until on the descent, about 400 feet lower, I fell in with more, and procured several large masses; in the same locality I found *Fuchsia splendens* in flower and seed, from which many plants have been raised and distributed.

Towards the village of BETAZA the vegetation is very poor, and the soil, from its aridity, scarcely cultivated. From Betaza to YALINA the road leads again over the river of Tabaa, about two leagues higher than where it had been crossed before, and offers again the same dry parched appearance.

Passing over the "MONTE DE YALINA" I observed towards the summit *Myrtus montana* forming a shrub two feet high, having a great resemblance to the common narrow leaved kind. There also I found again *Abies religiosa* and *Pinus Ayacahuite* which had been met with on the Pelado which is separated by a deep ravine from the Monte de Yalina. Following the steep descent the same plants appeared that had been observed on the ascent to the Pelado, and after an absence of eight and twenty days, during which time I travelled six hundred miles, I returned to the Hacienda del Carmen with several loads of plants.

Having returned to Oaxaca and despatched my collections to Vera Cruz, I resolved to undertake a journey to the south coast. The road leads along cochineal plantations, through the valley of Oaxaca, for nearly ten leagues, and then enters the mountains near San Andres, without offering much more than a few *Mimosas* and *Algarobia dulcis*. Near the Rancho del Aye, the river of Oaxaca, is bordered by fine specimens of *Taxodium distichum*, some of which measure between 4 and 5 feet in diameter. Ascending the mountain, I observed a tall *Cereus*, a *Cyrtopodium*, and a few *Epiphytes*. About two leagues further on, the mountains are well covered with a variety of *Oaks* and *Pines*, and from thence to the sugar plantation of Santa Ana, the same barrenness prevails as had been observed the day before. Near San Miguel Sola, I found *Cypripedium molle* in full flower, growing in the shade of Oaks. The valley of Santa Ana is barren and destitute of trees; sugar cane however is cultivated; but from the dryness of the soil and atmosphere, it does not succeed without artificial irrigation. Towards the Monte de la Virgin the vegetation improves; it was in this wood that I first found the Hand-tree, *Cheirostemon platanoides*, which here forms a tree 60 feet in height; it was at the time in which I first saw it covered with half ripe seed pods. A tree of this kind stands in the Botanic Garden of the city of Mexico, and another grows near Toluca, both of which have attained some celebrity, as no traveller who has seen them has ever failed to extol their rarity, they being considered to be the only two trees of the kind in existence until this station was found out.

Between Juquila, where I found *Catasetum laminatum* and other *Orchidaceæ*, and the villages of Panistlahuaca and Tepanistlahuaca, where I met with *Dioscorea macrostachya*, the savannahs offering but little during the dry season, I found a high ridge and arrived at SAN JUAN QUIAGE, where I discovered some very interesting plants. Towards Tecojomulco, *Pine woods* intermixed with *Oaks*, continue to the descent to San Andres in the valley of Oaxaca.

After returning to the town of OAXACA and despatching the collections which I brought with me from the south coast, I made an excursion to the CHINANTLA, which had been represented as being particularly worthy of my attention. The district so called lies in the mountains north of Oaxaca and comprises several Indian villages ; it is intersected by several large rivers which empty themselves in the Gulf of Mexico, measures about thirty leagues in length, and from one to five in breadth, and produces nearly all the tropical fruits cultivated in Mexico in addition to the *Soursop* (*Achras mammosa*) which is rarely seen in other parts of that country, and the "*Palao*," a species of *Passiflora*, having a yellow fruit three inches in length and two and a half in diameter ; the pulp of this being rather acid is chiefly used in making refreshments.

The whole district of the Chinantla from its broken surface and well wooded mountains offers a great variety of climate and vegetation, but from my visit happening near the end of the dry season my exertions did not meet my expectations. Having returned to OAXACA and despatched my collections to Vera Cruz, I prepared to resume my journey to Guatemala.

The following plants collected in the state of Oaxaca have flowered or been raised in the garden, viz. :

Epidendrum diotum	Catasetum laminatum
— cochleatum	— — var.
— virgatum	Maxillaria elegans
— radiatum	Peristeria Barkeri
— asperum	Gongora maculata alba
— bractescens	Lælia albida
— arbuscula	— autumnalis
— fragrans	— acuminata
— gladiatum	Ornithocephalus reflexus
— vitellinum	Stanhopea saccata
— falcatum	— oculata
Oncidium reflexum var.	Chysis bractescens
— ascendens	Cattleya citrina
— sanguineum	Cyrtopodium punctatum
— ensatum	Dioscorea macrostachya
— incurvum	Bessera elegans
— longifolium	Oxalis sp.
Galeandra Baueri	Mammillaria divergens
Acropera Loddigesii	— hystrix
Cyrtochilum hastatum	— elegans globosa
Catasetum maculatum	Echinocactus macrodiscus

Cereus sp.
Amaryllis sp.
Echeveria acutifolia

Dipsacozamia mexicana
Bocconia sp.
Rigidella immaculata.

On the 13th of August I finally left Oaxaca for Central America, passing once more near that extraordinary tree *Taxodium distichum*, which I had visited before on an unsuccessful excursion to the ancient palaces of Mitla. This tree stands in the village of Santa Maria del Ule, about seven leagues south-east of Oaxaca; it measures at 6 feet from the ground $32\frac{1}{2}$ Spanish yards, or 98 feet English measure in circumference, and is I believe the largest tree of its kind on record. The stem is not perfectly round, for several board-like excrescences descend the main stem in a longitudinal direction from a height of fifteen feet; these when they reach the ground are from 6 to 8 feet distant from the stem. At the height of 40 feet, the branches, each of which are good-sized trees of several feet in diameter, separate. The top, enormous although it appears, is not in proportion to the stem, both together measuring barely 100 feet in height. The tree grows in dry burning soil, it is surrounded by houses, and is in perfect health; Santa Maria del Ule, the name of the village in which this tree stands, derives the apposition "Ule" from the tree, and is still known by this name in other parts of the country where the same language is spoken. When we consider that at the conquest of Mexico the Spaniards allowed the name of this tree to be affixed to the patron saint of the village, the tree must have been even at that period of considerable size. This, although the tree is common in the milder parts on the eastern declivity of the great mountain range north of the city of Mexico, is the most southern specimen of the kind with which I fell in, and it has in all probability been brought from the north, and planted there like the Hand-tree, the two solitary specimens of which existing in the city of Mexico and near the town of Toluca, must have been brought from the south.

After leaving the valley of Oaxaca, the road gradually descends to the shores of the Pacific, along which I travelled for about one

hundred and thirty leagues. The rainy season having set in, and having already experienced difficulties in passing some rivers, I was obliged to abandon my plan of following the coast road to Guatemala. From the farm of Espiritu Santo, I struck in for the mountain road of Chiapas, and after a journey of three days I arrived at COMITAN, which is the last Mexican town on the frontiers of Central America, it is distant from the city of Guatemala one hundred leagues. After entering the confines of Central America, the road becomes more uneven until it reaches the highest point at Rosario, which, judging from the stunted appearance of *Juniperus mexicana* growing a few hundred feet above the range of *Abies religiosa*, is at an elevation of nearly 11,000 feet.

Near GUEGUETENANGO and CHIANTLA I first found *Lælia superbiens*, then opening fine rose-coloured flowers, which were supported on a stem from 3 to 5 feet in length; in the more shaded places, overhanging mountain torrents, I have observed the flower-stem sometimes 9 feet in length, but never more.

On the 26th of October I arrived in the town of QUEZALTENANGO, and finding the surrounding mountains likely to furnish plants suited to fulfil the object of my mission, I resolved to stay there. Quezaltenango is about 8,500 feet above the level of the sea, and is situated at the foot of the active volcano Xetuh, the summit of which is about 1,500 feet above the town; the lower portion of this mountain is partly cultivated; a few hundred feet higher up some stunted oaks, on which I found *Odontoglossum pygmæum*, are growing in company with *Comarostaphylis arbutoides*, the latter forming a tree 18 feet in height; near the crater of Xetuh I found *Fuchsia cordifolia* and the little *Polygonum volcanicum*. This volcano, when it first broke out, which is about forty-eight years ago, had been densely wooded, and a few large, dry, and blackened stems of *Pinus Ayacahuite*, some of which are still erect and overhanging the crater, bear witness to the fact. At the foot of Xetuh, as well as that of the neighbouring mountain

Santa Maria, the *Ayacahuite*, there called *Tablas*, is still common, and there are equally large trees with those observed on the Pelado in the Sierra of Oaxaca. It was at this station that I at length succeeded in obtaining a supply of ripe cones, which have been amply distributed among members of the society, and from which plants have been raised at the garden. It will no doubt prove quite hardy. Following the road at the foot of Xetuh for nearly three miles, I arrived at "Las Cruces," where I found *Solandra grandiflora* producing large yellow flowers, and clinging for support to other trees. Las Cruces is merely a place where a few rudely made crosses are fixed by the road side, in order to apprise the traveller, ascending from the lowlands, that he has reached the highest point on the road; this place is held in great veneration by the Indians, who often adorn the crosses with flowers, or burn incense, which is the produce of an *Elaphrium* found in the province of Soconusco. Descending gradually from Las Cruces towards the village of Santa Maria, I first found *Achimenes pedunculata* with a slender naked stem, 1 foot in height, having a few leaves at the top, and seldom bearing more than two flowers. The original plant is scarcely to be recognized in the large fine specimens cultivated in this country. *Peristeria Barkeri*, *Odontoglossum grande*, and *Rossii*, with *Oncidium leucochilum*, were also met with near Santa Maria.

Travelling to the village of Retahluleu, in the lowlands, near the shores of the Pacific Ocean, the road passes along the foot of the mountain Santa Maria, until it descends into the gloomy forests of the temperate region, where the showy *Justicia umbrosa*, *macrantha*, and *inæqualis*, all of which failed to vegetate in the gardens, attracted my attention; there I also found for the first time *Quercus Skinneri*, with its extraordinary acorn; the specimens rose to the height of 50 feet.

Passing from these temperate parts towards Retahluleu, *Orchidaceæ* became more plentiful, and *Epidendrum Stamfordianum*, *E. asperum*, *Fernandezia elegans*, *Brassavola venosa* and *Lælia*

acuminata, were found in abundance growing on the *Calabash* tree (*Crescentia Cujete*) in that village. This tree is peculiarly adapted to their growth.

On an excursion to SUNIL I passed near the morass of Almolonga, where I found *Escobedia linearis* growing in great abundance, and apparently enjoying a swampy situation, although often seen in dry and heavy soil. The root yields a yellow dye, resembling saffron. Upon entering the defile, after leaving the morass, I found *Cobæa macrostema* in full bloom, covering with slender vines anything with which it happened to come in contact.

The village of Sunil is situated on the western declivity of Xetuh, nearly on the same level as Quezaltenango, but, being surrounded by high mountains, the flora is materially different from that on the burnt up fields near that town.

The following is a list of the plants procured about Quezaltenango, which have flowered or exist at the Garden :

Oncidium leucochilum	Lælia acuminata
— nebulosum	— superbiens
Odontoglossum grande	Fuchsia cordifolia
— Rossii	Phaseolus sp.
— pulchellum	Comarostaphylis arbutoides
Epidendrum asperum	Passiflora stipulacea
— Stamfordianum	Centropogon cordifolius
— aurantiacum	Salvia involucrata
Peristeria Barkeri	— pulchella
Maxillaria variabilis	Cuphea pubiflora
Dinema polybulbon	Rubus trilobus
Hartwegia purpurea	Polygonum volcanicum
Hexadesmia fasciculata	Convolvulus sp.
Trichopilia tortilis	Bouvardia strigosa
Fernandezia elegans	Pinus Ayacahuite.
Brassavola venosa	

Having packed up my collections, and having failed to procure mules to carry the chests to Guatemala, I hired some Indians to transport them on their backs ; this sort of conveyance, although novel to me at that time, I subsequently made use of whenever quadrupeds could not be procured, or when care and despatch were required. The only drawback connected with the Indians is, that they must before starting get intoxicated with the money they receive on account

of freight, and then by way of diversion they commence fighting; this done, they resume their journey with sorrowful countenances, and contrive by forced marches to arrive within the stipulated time. The load for an Indian weighs from 80 to 150 lbs., and with this they will walk ten and fifteen days in succession, performing each day a journey of from twenty to twenty-five miles. The remuneration they receive is half of that of a mule load, which is always composed of two parcels, or about one shilling for every ten miles.

Once more I resumed my journey to Guatemala. After leaving Quezaltenango, and travelling about two miles along the swampy plain, which is considered to be the source of the river Motagua, the road gradually rises towards the village of TONICAPAN; the ascent becomes then more steep, and the sides of the mountain become covered with large evergreen *Oaks*, with scarcely any under shrubs except a few bushes of *Viburnum discolor*. Passing gradually from the region of *Oaks* to that of the *Pinuses*, I once more found some remarkably fine trees of *Abies religiosa*, together with *Pinus Hartwegii*. I may here observe, that this is the most southern station of *Abies religiosa*, with which I am acquainted, it having now been found at various places between 15° and 22° S.L.; its chief range however, is about 19°.

Passing over a slightly undulated surface I reached the high table land, which is thinly wooded with stunted trees of *Alnus mexicana*, on which I found in great luxuriance, the pretty little *Arpophyllum alpinum*, with short spikes of dark purple flowers. The elevation of this plain above the sea is at least 10,000 feet, and the black volcanic soil of which it is composed is chiefly occupied by a long coarse grass, which grows in large tufts, giving not the slightest chance to other plants. Cattle will not eat this grass.

Having crossed the plain I arrived at the descent to the farm of Argueta, which is known by the name of CUESTA DE LA ALHAJA; here my attention was arrested by the showy *Oxylepis lanata*, resembling in habit the dwarfer kinds of *Helenium*, and

bearing several large yellow flowers on a stem of 18 inches in height.

Near this place a singular custom is observed by the Indians, who, with loads on their backs, put their feet into a hollow rudely resembling the foot of a human being, made by nature in a large flat rock by the road-side. This precaution they say is necessary in order to prevent them from making a false step on the descent to Argueta. I have no doubt that the carriers of my chests of plants from Quezaltenango, went through this ceremony of "footing."

Descending the Cuesta de la Alhaja, where I found *Passiflora membranacea* and the pretty *Rigidella immaculata*, the latter growing in a dry hard loam, the ground becomes more uneven, and is for the greater part covered with evergreen Oaks, and *Pinus oocarpoides*. Near Santiago, I found *Pinus filifolia*, producing large cones and long foliage and rising to the height of 40 feet; judging from its habit and the exposed situation in which it was found, it will no doubt prove as hardy as most Mexican Pines.

Having arrived at the descent towards the village of Mixco, a beautiful panorama of the town of GUATEMALA, which lay in the plain below, burst open to the view; the pleasure I felt after such a long and toilsome, but withal interesting journey, may be easier imagined than described. The plain or rather valley of Guatemala, which is fifteen miles in length by nine in width, enjoys a delightful temperature, resembling that of the month of May or June in England; the lowest temperature I observed was in February, when the thermometer occasionally falls to 60° in the morning, and the warmest was in April, when it sometimes rises as high as 80°; during the rest of the year it ranges from 70° to 75°.

The plain in which Guatamela is situated, is about 5,000 feet above the level of the sea, and yet *Sugarcane*, *Bananas*, *Coffee*, *Cherimogers*, *Custard Apple*, *Peaches*, *Spondias Myrobalanus*, (from the fruit of which "Chicha," a favourite beverage of the

Indians is prepared), and *Indian Corn* succeed at this elevation. *Morus multicaulis*, which has lately been introduced for rearing the silkworm, thrives most vigorously and produces leaves during the whole year. The silk produced is of the finest quality and promises to become an important article of exportation. The greater part of the valley of Guatemala is under cultivation, and produces excellent crops of *Indian Corn*; the ravines by which it is surrounded on three sides, vary in depth from 100 to 500 feet; they have evidently been made, and are still being made daily, by the water from the plain and surrounding mountains, after a heavy shower, having washed away the thin cover of ferruginous clay, till it reaches the crumbled pumicestone of which the plain is composed, when that light material is also carried away by the flood. The sides of these ravines slope at an angle of 45° more or less, and a rivulet of insipid water winds its way through most of them. The pumicestone is not suitable for vegetation, unless it is well decomposed and mixed with vegetable matter; in this state it is the favourite soil of *Sobralia macrantha*, which is one of the most splendid of the Guatemala *Orchidaceæ*, unfolding, for several weeks in succession, rich crimson flowers, from 6 to 8 inches in diameter, supported on a reed-like stem, and forming a beautiful contrast between the dwarf, but not less handsome, *Achimenes longiflora*, growing by its side. This *Achimenes*, like *pedunculata*, has also been materially improved by proper cultivation. The flowers have become nearly double the size and are produced in greater abundance than in its native place.

The valley of Guatemala is destitute of trees, and for the greater part also of shrubs; it is chiefly on the sides of the ravines that *Oncidium Cavendishianum*, *leucochilum* and *Epidendrum aurantiacum* are to be found.

One of my first excursions after examining the vegetation about Guatemala was to the "Chorro," a little cascade by the roadside, about 12 miles N. E. of the capital; here I found again, though

not plentifully, *Brassavola glauca*, with large white lip and slightly scented flowers, growing in company with *Cyrtochilum maculatum* var., *Russelianum*, *Epidendrum varicosum*, and *fragrans*, *Brassia guttata* and *brachiata*, the latter remarkable for its long narrow sepals spotted with brown. On the steep rocks overhanging the rivulet the "*Papelillo*" (*Caloseris rupestris Benth.*) with long panicle and large leaves which are white underneath, formed a beautiful object. The stem of this plant is covered with a yellowish wool, which is used as a substitute for tinder. The woods about this place are composed of evergreen *Oaks*, and especially of *Pinus oocarpoides*, which attains the height of 50 feet; the chief range of this is at an elevation of about 4,000 feet, and though it descends nearly to the shore of the Bay of Honduras, it never occurs on the South coast, or higher than 5,000 feet above the level of the sea. It is to be feared that it will prove too tender for English gardens. The same may be said of *Pinus tenuifolia*, which I found in ravines east of Guatemala, and on the mountains of Choacus in the province of Vera Paz, only a few hundred feet higher than *Pinus oocarpoides*. In the more sheltered places I often found this 100 feet in height and from 3 to 4½ feet in diameter at the base. Scarcely a shrub or herbaceous plant is found in these *Pine* tracts.

On an excursion to the lowlands bordering on the Pacific Ocean, the road led me through the valley of Guatemala, and after a short but rather steep descent, I passed the lake of AMATITLAN, and entered the village of the same name. The dry atmosphere and arid soil are not favourable to much variety in the vegetation, but are well adapted to the cochineal which is here produced in great abundance and of the finest quality. Following the gradual descent, and entering shaded woods, I met with *Stanhopea saccata*, *Trichopilia tortilis*, *Mormodes lineatum*, the latter scenting the air with its fragrant flowers, and *Cycnoches ventricosum*. The latter, now well known for its tendency to sport never did so as far as I could

observe in its native haunt. Although Mr. SKINNER, who was with me on one of these excursions, called my attention to the then supposed *C. Egertonianum*, yet among several dozen plants that I had collected out of flower, after careful examination I could only discover the short flower stem of *Cycnoches ventricosum*.*

The village of ESCUINTLA, where I next arrived, is on the same level as Retahluleu, which I had visited from Quezaltenango, and it yielded me the same plants found at the latter place with the addition however of *Catasetum maculatum*, and *integerrimum*, *Aspasia epidendroides*, *Oncidium ascendens*, and the large variety, of *ampliatum*, *Epidendrum macrochilum*, *Brassavola venosa*, *Trigonidium Egertonianum* and *Cattleya Skinneri*; the latter I found inhabiting the highest trees, in abundance, in full bloom in the month of February, in the damp and gloomy woods looking towards the sea.

From Escuintla I returned over MEDIO MONTE to Antigua Guatemala. The name of Medio Monte is applied to the wood between the fire and water volcanoes, which at their base are only a few hundred yards apart; this wood furnished me with some fine specimens of *Oncidium ornithorhynchum*, *Maxillaria cruenta*, and *aromatica*; and in the higher parts, *Oncidium macrantherum*, and *O. Wentworthianum*, with a long flower stem resembling in habit *O. leucochilum*; here also a few small plants of *Barkeria spectabilis* have been found. Some fine masses of the latter as well as of *Epidendrum Skinneri*, *Oncidium Cavendishianum* and *Stanhopeas* are sometimes seen in the villages of Mixco, Sumpango, and Alotenango, where they are stuck on the trees near the houses, merely surrounded at the roots with clay to prevent them from being

* A similar freak of Nature I observed in Guatemala with *Sobralia macrantha* which had its usual large crimson flowers on one stem, whilst on another of the same plant I observed the small and condensed flowers of the genus *Evelyna*. This plant I carefully removed and transmitted to the Society's Garden with the head of the *Evelyna* attached to it. It has since flowered, but only produced the flowers of *Sobralia macrantha*.

blown down, by this means they form better plants and flower more freely than in their native woods. The Indians, who grow them for the sake of the flowers to adorn their altars, are generally very reluctant to part with these plants.

The VOLCAN DE AGUA, or water volcano rises to the height of 12,600 feet above the level of the sea, and is about 6,000 feet higher than the plain on which Antigua Guatemala or the old town of Guatemala is built; it is regular on all sides, representing the form of a sugar loaf with the point cut off. It received the name of Volcan de Agua from the Spaniards, under Alvarado, who after subduing the country, formed a settlement at the foot of this mountain. It, however, was soon destroyed by a torrent of water issuing forth from the summit, and carrying every thing before it. The deep furrows which the water made in its descent, although now again covered with vegetation, are still plainly visible even from the new town of Guatemala, a distance of 25 miles. The lower region of this volcano is under cultivation, or is pasture land, while at an elevation of 9,000 feet a girdle of trees passes round it, the most conspicuous of which is *Cheirostemon platanoides*, which also occurs at the same elevation on the Volcan de Fuego, where it attains the height of from 60 to 80 feet, often forming a stem of 4 feet in diameter. Having passed this region, a long grass covers the ground, which makes the hill, which is steep, still more difficult to ascend. A *Veratrum* like *Zygadenus volcanicus*, was found here, throwing up a branched flower stem of 3 feet in height, covered with pendulous scented flowers of a dingy yellow; and by its side *Berberis gracilis*, which I recognised immediately by its slender growth and red petioles, although without either flower or seed. After much halting on account of the steep ascent and rarified air, which made breathing continually more difficult, I at length arrived at the brink of the crater, climbing the ascent from the village of Santa Maria in four hours. A few minutes delay would have deprived me of the view I had, for the clouds arose rapidly from the

plain below, and soon obscured even the interior of the crater in such a manner that I could not clearly distinguish its sides afterwards, although I encamped in it for the night, and staid there part of the next day.

The crater is similar to an immense caldron, about 300 feet in width at the top and 150 feet in depth. Its nearly perpendicular sides admit of only one descent, at a place where they appear to have fallen in, or to have been carried away by the eruption of the water. The bottom is perfectly flat and consists of black volcanic ashes, strewed with a few blocks of porphyry which had been detached from the sides above. The present state of the crater is not easily reconciled with the account of eruption of water that occurred about three centuries ago; for if we suppose the water to have sprung from an internal opening of the crater, how can we account for its present level state? and if, as some have supposed, the water that burst forth, had been collecting in the crater during the heavy periodical rains with which that country is visited, how could the volcanic ashes, of which the bottom is composed, have retained it? With regard to the ashes, found in the crater, we might ascribe the circumstance to the Fire volcano close by, (which even now throws out a column of smoke), if we had had any large eruptions on record posterior to that of the water. That the so called water volcano had at one time largely contributed in covering the country for leagues around with beds of ashes and pumice stone, we cannot for a moment doubt, considering its enormous crater. And with regard to the eruption of water, we shall not be far from the truth in ascribing it to a waterspout alighting near the crater; a circumstance not at all improbable, for such occurrences are not rare. I have observed the effects of three of very recent date, one in the mountains of Oaxaca, and two in the Andes of Popayan, where the water in its descent swept away the largest trees, and left furrows similar to those on the Volcan de Agua.

The bottom of the crater, which is but scantily covered with vege-

tation, furnished *Aplopappus stoloniferus*; and a Commelynaceous plant which constitutes a new genus (*Lampra volcanica Benth.*) was found unfolding pretty white flowers where the blocks of stone afforded it a little protection, whilst in the more exposed places it had been nipped by frost. The only tree which grows near the crater and even inside of it is *Pinus Hartwegii*; and these specimens are equally large with those observed in Mexico. The cones which had been but sparingly produced that season were then (in August) half ripe; and the squirrels which visit that desolate region had eaten them even in that state.

During my stay in Guatemala, I saw this mountain twice covered with snow, or rather with hailstones; but the top not being within the limits of perpetual snow, the latter seldom lies more than two or three days. No water being found on the ascent after leaving the village of Santa Maria, I had to include that article among my provisions, although I was rather liberally supplied from above, during the night which I passed in the crater.

Crossing the plain of Guatemala in a southerly direction, I ascended the gentle acclivity of the CUESTA DE PINULA, and arrived at the farm of ARRASOLA, which is situated about 500 feet above the plain. The undulated surface, clothed with a green sward and detached shrubberies, presented a beautiful picture, and strongly reminded me of park scenery in England. In the shaded woods in dells, I found *Odontoglossum grande*, bearing from 3 to 4 large showy flowers on a spike; in the more exposed situations *Ornithocephalus inflexus*, *Cœlia macrostachya*, with dense spike of rose-coloured flowers, and *Oncidium pergameneum*, *bicallosum*, and the latter with a flower-stem equalling the leaves, and large yellow flowers, were collected.

Having here received instructions from the Council of the Society, to proceed to the equatorial Andes, I packed up my collection; duplicates from which I remitted from time to time.

The following is a list of plants collected in Guatemala, which

have flowered in the garden; besides these, however, there are many Orchidaceous and other plants, which have as yet not shown any disposition to flower.

Aspasia epidendroides	Oncidium filipes
Barkeria spectabilis	— leucochilum
Brassavola glauca	— macrantherum
— venosa	— microchilum
Brassia brachiata	— ornithorhynchum
— guttata	— pergameneum
Catasetum integerrimum	— sphacelatum
— maculatum	— — var.
— Russellianum	— Suttoni
Cattleya granulosa	— Wentworthianum
— Skinneri	Sobralia macrantha
Cœlia Baueri	Spiranthes rosulata
— macrostachya	— cerina
Cynoches ventricosum	— grandiflora
Epidendrum alatum	Stanhopea saccata
— aurantiacum	— Wardii
— diotum	— — var.
— incumbens	Trichocentrum candidum
— lacertinum	Trichopilia tortilis
— macrochilum	Trigonidium Egertonii
— polyanthum	Achimenes longiflora
— selligerum	— pedunculata
— Skinneri	— rosea
— Stamfordianum	Aristolochia Gigas
— varicosum	Begonia crassicaulis
— virgatum	— incana
Govenia liliacea	— vitifolia
— sp.	Cheirostemon platanoides
Lacæna bicolor	Drymonia punctata
Lælia superbiens	Fuchsia splendens
— acuminata	Gesnera longifolia
Maxillaria aromatica	Hydrotænia Meleagris
— concava	Hymenocallis patens
— cruenta	Ipomæa rubro-cærulea
— densa	Lampra volcanica
Mormodes lineatum	Niphæa oblonga
— aromaticum	Pancreatium sp.
Notylia bicolor	Passiflora membranacea
Odontoglossum bictoniense	Pinus filifolia
— elatum	— tenuifolia
— grande	— oocarpoides
— pulchellum	Quercus callosa
Oncidium ampliatum large var.	— Skinneri
— ascendens	— — var.
— bicallosum	Rigidella immaculata
— Cavendishianum	Salvia prunelloides
— Cebolleta	Zygadenus volcanicus.

Being unable to procure a passage to GUAYAQUIL whither I had

orders to proceed, in consequence of the little traffic carried on between the two countries, I eventually sailed from the port of REALEJO, and after what might be considered a fine passage of 36 days, I landed at CALLAO on the coast of Peru. Having stopped here for a few days, I made an excursion from LIMA towards ACOBAMBA. This is situated in the CORDILLERA, which rises behind the capital and which attains its highest point at the Toldo de nieve, (tent of snow), being a broad sheet of perpetual snow visible from Callao. The lower part of this Cordillera, and indeed the whole coast of Peru, from the total absence of rain, presents a most desolate appearance, and the eye in vain searches for a green spot for relief. Entering the ravines, I observed a few plants of *Cereus senilis* and another tall growing species; the former however seldom attains more than 10 feet in height, nor has it the long white hairs with which that species is covered in Mexico. Near the solitary bluff rock, called Paucacha, which is barely within the influence of the periodical rains, I found a beautiful bright orange-flowered *Tacsonia*, also *Oxalis rubrocincta*, *Berberis dealbata*, *Colletia horrida*, and a *Hesperomeles* with long thorns.

Returning to LIMA, and finding that the vessel in which I had engaged a passage was to sail shortly, I repaired to CALLAO, and after a passage of nine days with a favourable breeze and current, we entered the river Guayas, on the right bank of which the town of GUAYAQUIL is situated. The country hereabouts is flat and well wooded, particularly along the river; but the myriads of mosquitoes which inhabit the thickets, make the examination of their flora anything but agreeable. The thermometer ranges here from 80° to 85° throughout the year, with little variation during night; this temperature, which is considerably less than that of the east coast in a similar latitude, is no doubt owing to the high Cordillera in the interior, and also to numerous snow clad mountains, of which, Chimborazo is visible from the coast. These no doubt contribute in lowering the temperature.

Orchidaceæ which I expected to find in abundance in the shaded woods along the river, were comparatively scarce, and my exertions were only rewarded with four species, which although they arrived safely have not yet flowered.

Towards the middle of May the periodical rains, which make travelling in the Andes next to impossible, having ceased, I resumed my journey to Loxa. A three days sail in a canoe down the river Guayaquil, brought me to the village of SANTA ROSA, from whence I started on the following day for the village of Paccha, which is distant about fourteen leagues, for the purpose of procuring mules to bring up my luggage. This journey gave me some insight with regard to the roads that I should have to take in pursuing my occupation in the Andes. The road as far the Tambo de la Chonta, a distance of seven leagues, leads through a narrow ravine, and crosses the rivulet which flows in it sixty-five times; these repeated crossings although the water is scarcely 3 feet in depth, became at every step worse, for the large stones, which had been carried down during the rains, rendered the footing of mules unsafe. The TAMBO DE LA CHONTA, where I arrived towards the evening, is only a thatched roof supported on a few beams, affording the weary traveller no other accommodation than that of shelter; the ascent which had hitherto been comparatively trifling becomes steeper; and the large trees, *Palms*, and thick underwood bespeak a damp climate.

The village of PACCHA, (if twenty mud-built houses deserve the name), is about 5,000 feet above the level of the sea and enjoys a delightful temperature; *sugarcane*, *coffee*, *yuca*, (*Jatropha Manihot*), *oranges*, *pine-apples*, come to perfection at this elevation. The shaded woods and dells furnished me a great variety of *Orchidaceæ*, among which an *Oncidium* from its singular habit particularly attracted my attention; this plant throws up a slender branched flower stem from 10 to 12 feet in height and produces pseudo-bulbs from the stem itself; these in the course of time form plants

again, sending their offspring a couple of yards higher up, and thus often a single plant runs up a tree 25 feet in height. This species together with twenty more, which I collected in these damp woods, was ill fitted to withstand the long journey round Cape Horn; and, consequently the greater part of them when they arrived in England were dead; of those surviving, *Stanhopea Bucephalus* and *Lycaste lanipes* alone have flowered.

From Paccha towards Loxa, the ground is extremely uneven. Near the Indian village El Sisne, at an elevation of nearly 9,000 feet, I found *Stenomesson aurantiacum*, displaying bright orange flowers, and several large-rooted species of *Macleania*, with *Myrica macrocarpa*, from the seeds of which the industrious Indians obtain a green wax, employed for religious purposes. Descending to the valley of EL CATAMAYO, the presence of *Agaves*, *Mimosas*, a triangular *Cereus*, *Schinus Molle* (here called "Molle," or pepper tree), *Elaphrium* and *Crotons*, indicated a dry atmosphere. A tree called *Arupo* (*Chionanthus pubescens*), inhabiting the steep sides of the mountains, formed a conspicuous object; its delicate rose-coloured flowers, produced in great abundance before the leaves, are visible at a great distance, and contrast well with the apparently dead vegetation around. From the farm of El Catamayo, where sugar-cane is cultivated, to the town of LOXA, a distance of five leagues, the main Cordillera has to be crossed; this part of the Andes is of easy access and is scarcely more than 8,000 feet above the sea; it has formerly been a *Cinchona* forest, but since the *Quina* has become an article of commerce, the *Cinchona* has gradually disappeared, on account of the bad system which is pursued in obtaining the bark by uprooting the plant. The best *Quina* or *Cascarilla* is yielded by *Cinchona Condaminea*, which is 6 feet in height; several other species of arborescent *Cinchonas* abound in the mountains of Loxa, but their bark is considered to be inferior to this. In the more exposed situations of this Cordillera, I collected several

species of *Befaria*, also *Macleantias* having large fleshy roots, *Vacciniums*, *Fuchsia loxensis*, *Barnadesia spinosa*, *Berberis glauca*, *Alströmerias*, *Hypericum laricifolium*, yielding a yellow dye, a *Viburnum* and *Lupinus semperflorens*, the latter forming a shrub 12 feet in height, and flowering profusely throughout the year.

Orchidaceæ also, are to be met with at this elevation, but they are more abundant in the woods a few hundred feet lower; the damp atmosphere which prevails about Loxa, is favourable to the growth of that class of plants, but renders them unfit to undergo a long journey; of seventy species which I collected here, very few succeeded after their arrival in England. The thermometer at Loxa, stands generally between 60° and 65°; the rainy season sets in in December and lasts until May, when it is followed by the "paramos," light but continued rains unaccompanied by thunder. These paramos are peculiar to the more elevated parts of the Andes, where that term is also applied to the grass lands (pajonal) above the regions of trees; they seldom pass their prescribed limits by descending into the warm vallies or down to the coast; an instance of which I observed on my arival at Loxa from El Catamayo, for in a distance of five leagues, in the former place it had been raining for several days, whilst in the latter every thing was burnt up by the continued drought. About Loxa, the lower region of the mountains, to which I made frequent visits, furnished me with *Tropæolum peltophorum*, *Lupinus arvensis*, *Berberis loxensis*, an *Oreocallis*, several species of *Rubus*, *Hypericum*, *Monnina*, and *Alströmeria*, whilst the more elevated parts were rich in *Compositæ* and *Ericaceæ*. A small tree called *Ducu* (*Clusia Ducu* Benth.) is also found in this region, exuding a yellowish transparent resin from the stem, which is used as incense.

The *Wax palm* (*Ceroxylon andicola*) occurs at an elevation of nearly 8,000 feet; the stem, which attains 60 feet in height

and from 12 to 18 inches in diameter, is in the larger specimens covered with a thin coating of a whitish, waxy substance. This when purified in hot water, becomes compact, and acquires a cream colour. It is generally mixed with a little tallow if made into candles, being of too brittle a nature to be worked by itself; it then burns with a bright flame without any smell or smoke. The quantity of wax from a full grown palm varies from 12 to 25 pounds.

In the ravine leading to the village of Saraguru, I found *Brugmansia sanguinea* called *Guando*, forming a shrub 12 feet in height; the seed-pod of this, as well as the seeds, is considered to be highly narcotic, and to cause death. In this ravine I likewise found a *Walnut* allied to *Juglans nigra*, called *Tocte*, several Melastomaceous and Myrtaceous shrubs, *Eccremocarpus longiflorus*, and a pale yellow flowering *Tropæolum*, the latter ascending to the tops of the highest trees. On the bluff rocks near the village, I observed *Phycella chloracra*, having scarlet flowers tipped with green, but from its inaccessible habitat, I could procure only a few bulbs.

After a stay of four months in Loxa, during which time I formed large collections of plants and seeds, I resumed my journey, and arrived at the town of CUENCA, which is forty leagues north of Loxa, and became my head quarters. The greater part of the road, after emerging from the ravine of Saraguru, leads over the Paramo (grass lands) at an elevation of from 10,000 to 11,000 feet above the level of the sea. Near the Tambo de Mariviña, I found *Odontoglossum pardinum*, growing on trees, associated with *Berberis conferta* and *glauca*, two species of *Osteomeles*, a tall shrubby *Lobelia* with large yellow flowers, *Alströmerias*, a *Ribes* with greenish flowers and several shrubby *Hypericums*. Having made repeated excursions to the neighbouring mountains with no great success, I visited the warm valley called *Yunguilla*, where I was rewarded with the bulbs of a yellow flowering *Cybister*, a scarlet

Phycella, and a large rooted *Gesnera*, all flowering before the leaves appear.*

Towards the end of January 1842, I left Cuenca and reached RIOBAMBA, by passing over the Paramo del Assuay, which lies at an elevation of 15,000 feet above the level of the sea. This "highway," being the only means of communication between the two towns, is justly dreaded by the natives, as the sudden hail-storms and rain, with which this desolate region is visited, make travelling at all times a hazardous undertaking. The highest point of Assuay is about 500 feet above the road, or 15,520 feet above the sea, and is consequently scarcely within the limits of perpetual snow, although repeatedly covered with it in summer, during the dry season, which is from June to October, when the snow-line in the Andes descends much lower than during the rainy season or winter. At this elevation several species of *Gentiana*, *Culcitium rivale*, *Sida phyllanthos*, with a large purple flower resembling a *Crocus*, and a small creeping *Lupine* were observed; in wet places a red *Lycopodium*, called in the Quichua language *Hatun condenado* (great devil) is abundant; highly medicinal properties are ascribed to this plant by the natives, who employ it for the cure of that horrible disease, Mal de San Lazaro (*Elephantiasis tuberculata*), which is so common in the equatorial Andes; but I could not learn that they derive any benefit from its application.

RIOBAMBA, or CIUDAD DE BOLIVAR, as it is now called, agreeably to a late decree of the equatorial government, stands in the midst of a sandy plain almost destitute of vegetation, at an elevation of 9,472 feet. The majestic Chimborazo, which rises gradually out of the plain at a distance of six leagues, attaining the height of 21,441 feet above the sea, with Carguairazo a little to the north, and Tun-guragua and Capac Urcu, called El Atar by the Spaniards, in the north east, form a magnificent mountain prospect if viewed from the

* The box containing the above, as well as the seeds and dried specimens collected about Cuenca, were despatched viâ Guayaquil, but never reached England.

great square in Riobamba. Chimborazo, like most elevated plains in the Andes, is destitute of trees and shrubs ; the highest range of cultivation we find is, at the farm of CHUQUIPOLLO, at an elevation of 11,500 feet ; *barley*, *potatoes*, "*Mayua*" (*Tropæolum tuberosum*), "*Oka*" (*Oxalis tuberosa*), and *Lucerne*, form the chief objects of agriculture. Here I found *Salvia macrostachya*, a *Castilleja*, *Plantago*, *Calceolaria ericoides*, *Alchemillas*, a *Ranunculus*, a *Rumex*, with large leaves resembling *R. Patientia*, several species of *Baccharis*, *Grasses* and *Ionidium parviflorum*. The latter is called "*Cuichunchullu*," (*i. e.* bowels of the guinea pig,) and is in repute as a remedy for the mal de San Lazaro, but from the frequency of that disorder in Riobamba, Huano, and Cuenca, where the *Cuichunchullu* is so easily procured, and where no complete cure of confirmed leprosy has ever been effected, it may be concluded that its virtues are greatly exaggerated.

The ascent from the farm of Chuquipollo to the snow-line, a distance of nine miles, is easily accomplished in three hours ; judging from the eye, the distance seems much less than it really is, a deception arising from the brilliancy of the snow. Two or three species of grass, which leave but little chance for other plants, densely cover the ground, until at an elevation of about 15,000 feet, they gradually give way to the more interesting Alpine flora, which extends to the limits of perpetual snow. Among the plants collected here, I may mention several species of *Gentiana*, *Valeriana*, *Lycopodium*, *Draba aretioides*, *Arabis andicola*, a *Jamiesonia*, *Cerastium densum*, *Astragalus geminiflorus*, several species of *Lupinus*, among which *L. alopecuroides*, was remarkable for its dense inflorescence of 2 feet in height, and an *Halenia*. *Culcitium reflexum*, *nivale* and *rufescens*, or "*Fraylejon*," with a woolly head and large cernuous flowers are found in abundance on the sandy tract within a few yards of the perpetual snow and at an elevation of 15,800 feet above the level of the sea.

Having made several excursions to Penipe, the lake of Colta

near the ruined town of Caxabamba and Tunguragua without finding many plants worthy of notice, I repaired to QUITO, about the middle of March 1842.

The eastern declivity of Pichincha, at the foot of which the town of Quito is built, at an elevation of 9,400 feet, retains its verdure throughout the year; here *Brugmansia sanguinea*, a shrubby *Euphorbia*, *Duranta triacantha*, *Prunus salicifolia*, *Clematis sericea*, are employed in forming fences, whilst on uncultivated spots and by the sides of ravines we find *Thibaudia acuminata*, *Salvia rubescens*, *Lamourouxia virgata*, *Gesnera ulmifolia*, *Lupinus pubescens*, *Oenothera sinuata*, *Sedum quitense*, several species of *Fern*, *Calceolaria*, *Solanum*, *Cestrum*, *Melastoma*, *Compositæ*, and a few *Grasses*. The region of arborescent shrubs, which extends to an elevation of 12,000 feet, is chiefly composed of *Buddlea pichinchensis*, *interrupta*, and *bullata*, *Barnadesia spinosa*, *Monnina nemorosa*, *Andromachia igniaria*, the bark of which is used for tinder, several species of *Hypericum*, and *Baccharis*, *Eupatorium glutinosum*, called *Matico*, whose dried leaves reduced to powder are useful in stopping bleeding and healing wounds, *Gaultheria pichinchensis*, *insipida*, and *purpurascens*, *Vaccinium Mortinia*, *Cremolobus peruvianus*, the rich *Fuchsia ampliata*, with *Rubus glabratus*, *pichinchensis*, and *glaucus*, the latter bearing a large black fruit resembling a mulberry in flavour. Here was also a kind of *Bamboo*, which formed impenetrable thickets.

The region we next enter is that of the Paramo, or Pajonal, presenting to the eye an unvaried expanse of long grass, constituting the pasture of the Andes; here we find *Ranunculus peruvianus*, *Valeriana hirtella*, *Andromachia acaulis*, *Swertia umbellata*, *Werneria nubigena*, a dwarf shrubby *Vaccinium*, *Gentiana sedi-folia*, the smallest in the Andes, the corolla of which closes immediately when taken up, *Petroselinum depictum*, and near the sandy crater, in addition to most of the plants observed on Chimborazo, *Sida pichinchensis*, *Draba alyssoides*, and in clefts of rocks the rare *Saxifraga andicola*.

Pichincha attains a height of 15,979 feet, and although repeatedly covered with snow, the latter seldom remains long. The line of perpetual congelation under the equator is fixed by Humboldt at 15,736 feet, but this limit admits of local variation, as for example on Cayambe, where a broad sheet of snow extends over a gradual descent, and is found as low as 14,200 feet; whilst on Chimborazo, where the form of the mountain is more conical, it ascends to 16,000 feet. The crater of Pichincha, which looks like an immense ravine, having an opening towards the west coast or in the opposite direction of Quito, is inaccessible on all sides, and is probably not less than a thousand feet in depth. Many centuries have elapsed since it existed in full activity, when it must have largely contributed to covering the country around with pumice-stone and ashes; now, though still smouldering, its present commotions are the enfeebled efforts of age.

The western declivity of Pichincha, to which I made frequent excursions, afforded me *Andromachia solidaginea*, *Valeriana microphylla*, *Viburnum pichinchense*, *Arracacha acuminata*, *Tacsonia quitensis* with an oblong acidulous fruit, *Rubus stipularis*, *Fuchsia sylvatica*, *sessiliflora*, *scabriuscula*, and *dependens*, the latter forming a large shrub, producing numerous scarlet flowers at the points of the slender branches which give it a graceful appearance, an *Iochroma* with large dark blue flowers two inches in length, *Mutisia Clematis*, *Mikania corymbulosa*, *Miconia pichinchensis*, *Macleania cordifolia*, having a large fleshy root, *Thibaudia pichinchensis*, *Palicourea lineata*, and in the more temperate parts towards the uninhabited woods of Esmeraldas, *Centropogon calycinus*, and *prostratus*, *Begonia longirostris*, *Quercus Benthamiana* forming a middle sized tree with wide spreading branches and large leaves which are brown underneath, the rare *Fuchsia longiflora*, several species of *Orchidaceæ*, among which *Epidendrum amethystinum*, and *porphyreum* and *Cypripedium macranthum*, are the most remarkable, the latter preferring wet situa-

tions and producing large greenish brown flowers on a scape of three feet in height. The singular *Ophioglossum palmatum*, already known from having been received from various parts of the globe, is also found here growing on trees, but it is by no means common.

Travelling to Antisana, whose broad cone covered with perpetual snow is plainly visible from Quito, I crossed the well cultivated valley of Chillo to the farm of EL ISCO, which is situated at an elevation of 11,400 feet; here the cultivation of barley and potatoes is carried on with success; the plants which I observed there were *Onoseris eriocephala*, *Senecio pimpinellifolius*, and *Antisanæ*, *Culcitium rosmarinifolium*, *Erigeron campanulatum*, *Liabum acaule*, and in the clefts of rocks overhanging the farm-house *Stenomesson Hartwegii*, producing its scarlet pendulous flowers on a scape of 18 inches in height. I may here observe that bulbous plants are by no means common in the Andes, for besides the last mentioned I only found two other species on old walls in Quito, where they have been apparently planted, and *Phædranassa obtusa*, on the banks of the Guallabamba and in the valley of San Antonio.

Following the gradual ascent from El Isco, I arrived at the farm-house of ANTISANA, which is situated in a grassy plain at an elevation of 13,434 feet, and within four miles of the snow-line. This ground being extremely rich in Alpine plants, furnished me with *Gentiana diffusa*, and *rupicola*, *Ranunculus nubigenus*, *præmorsus*, and *sibbaldioides*, *Castilleja nubigena*, *Euphrasia stricta*, *Liabum erigeroides*, *Bowlesia acutangula*, *Werneria densa*, *Aster rupestris*, *Culcitium ascendens*, and *hyoseridis*, *Eryngium humile*, *Valeriana plantaginea*, *Baccharis humifusa*, *thyoides*, and *alpina*, *Ribes frigidum*, and two species of *Urtica*, together with *Chuquiraga lanci-folia*, with showy heads of yellow flowers, which is the only shrub that supplies the herdsmen of the estate with fuel. On the eastern slope of Antisana, near the swampy outlet of the Lake of Mica, I observed *Gentiana limoselloides*, *Plantago nivalis*, *Vaccinium empetrifolium*, and *penæoides*, *Lysipoma montioides*, *Liabum erige-*

roides, *Azorella aretioides*, *Werneria disticha*, *Potentilla andicola*, *Alchemilla nivalis*, and a moss-like plant supposed to be a species of *Sisyrrinchium*, forming large tufts several feet square, and rising from one to two feet above the surface of the soil; these masses are so compact that with great difficulty I succeeded in separating a piece.

The proper season for travelling having arrived, I became desirous to resume my journey northwards, I accordingly despatched the collections made about Quito to Guayaquil, and set out on the 21st of July for POPAYAN, where I arrived on the 17th of August, after a painful journey of twenty-six days.

The town of Popayan being situated in the valley of the river Cauca, at an elevation of 5,900 feet, enjoys a mild climate, the thermometer ranging between 65° and 70° throughout the year; most European fruits are cultivated here by the side of *Cherimoyers*, *Coffee*, *Sugarcane*, *Pine-apples*, *Granadillas*, and several kinds of *Plantain*; among the latter I observed one called *Pacifico* or *Otahete*, esteemed for its fruit, which for size and flavour is between *Musa sapientum* and *paradisiaca*; it is of recent introduction, and judging from the name has been brought from some of the islands in the Pacific Ocean.

The Central Cordillera at the foot of which the town of Popayan is built, and which is scarcely ever less than 10,000 feet in height, attains its greatest elevation in the peaks of Puracé, and a little more to the south in Zotara; they are both considerably above the snow-line. The slopes of these mountains and the mountain-pass of the Paramo de Guanacas, which connects the valley of the Cauca with that of the Magdalena, afforded me ample occupation. Here I found *Myrica mollis*, *Psidium sericiflorum*, *Eugenia Guayaquilla*, *Meriania majalis*, called *Flor de Mayo*, being a beautiful shrub with large purple flowers, *Palicourea popayanensis*, *Escallonia caracasana*, *Cinchona pubescens* or "*Palo requeson*," a tree from 20 to 30 feet in height producing sweet scented

flowers, *Loranthus catacarpus*, *Cerasus opaca*, *Quercus Humboldtiana*, forming a large forest tree, and occupying a range from 7,000 to 8,000 feet, *Gaultheria anastomosans*, *Siphocampylus cordifolius*, *lanatus*, and *Columnæ*, *Befaria phillyreæfolia*, an evergreen shrub of striking beauty, producing rose-coloured flowers in abundance at the points of the shoots; in the more elevated parts, *Fuchsia canescens*, and *corollata*, *Macleania pubiflora*, *Thibaudia hirtiflora*, and *parvifolia*, *Ribes leptostachyum*, *Linochilus floribundus*, *Ceratostemma rigidum*, *Vaccinium densiflorum*, and *acuminatum*, *Espeletia grandiflora*, *Lobelia rupestris*, and *andina*, *Myrtus oxycoccoides*, *Valeriana bracteata* and *Apium glaucescens*. The *Cinchona* woods of Pitayo, which are famous on account of the bark they produce, lie about forty miles N.E. of Popayan in the Central Cordillera, at an elevation of 8,000 feet; the species which abounds there is *Cinchona lanceolata*, called "Red bark," a tree between 40 and 50 feet in height, the bark of this, is however, considered inferior to the "Orange bark," the produce of *Lisyanthus densiflorus* which is a shrub with large shining leaves and yellow flowers, belonging to the natural order *Gentianaceæ*. Here I collected *Mikania rufa*, *Coffea marginata*, the large scarlet flowering *Mutisia grandiflora*, *Begonia trachyptera*, *Spigelia pedunculata*, the leaves of which prove fatal to dogs, *Viscum clavatum*, and *squamigerum*, *Clethra bicolor*, *Gaultheria cordifolia*, *Thibaudia pubescens*, and *pendula*, *Vaccinium epacridifolium*, and several minute *Orchidaceæ*.

The western Cordillera seldom attains more than 9,000 feet of an elevation and terminates abruptly towards the coast, presenting a boundless uninhabited forest. The principal objects derived from this expedition were four species of *Palms*, among which was the "*Chontadura*," having a slender prickly stem between 40 and 60 feet in height, with a raceme of flowers eighteen inches in length, and producing from 150 to 200 yellow nuts about the size of a large green walnut. The thick rind surrounding the seed of these,

when boiled resembles in flavour a Spanish Chesnut; in boiling, the rind yields an oil which may be used for culinary purposes or for burning.

Towards the middle of December after packing up what I had collected about Popayan, I proceeded with my collections to BOGOTA. Passing over the Central Cordillera by the Paramo de Guanacas, I entered the valley of the Upper Magdalena river at the village of La Plata, and following the arid banks of that river I arrived on the 1st of January 1843, in Bogota, after a fatiguing journey of twenty-days. The sudden change of temperature from the warm valley of the Magdalena to the cold table-land of Bogota, was probably the cause of my contracting a fever and ague, from which I suffered during the month of January, and which prevented me from following my occupation during that time.

The town of Bogota being built at the foot of the western Cordillera, at an elevation of nearly 9,000 feet enjoys a mean temperature of 56° and notwithstanding the swampy plain in front, through which the river Bogota slowly winds, the town is considered healthy.

The aspect of the vegetation round Bogota is at first glance anything but encouraging for a botanical collector; upon a closer inspection, however, I found that the apparently barren mountains were covered with some very interesting plants, and particularly the ravine which descends the Cordillera, and whose clear stream supplies the town with water; here I found *Gaultheria ramosissima*, and *conferta*, *Gaylussacia buxifolia*, *Chætogastra microphylla*, with small yellow flowers, *Spiræa argentea*, *Thibaudia floribunda*, with a large fleshy root, *Fuchsia petiolaris*, an *Oncidium* with yellow flowers supported on a stem three feet in height, and a half-climbing *Begonia* with large scarlet flowers adorning the rocks with gay colours. Following the steep ascent to the Paramo, I observed *Linochilus rosmarinifolius*, *Palicourea vaginata*, *Eupatorium amplum*, *vacciniæfolium*, and *latipes*, *Drymis granatensis*, called

“*Palo de aji*,” or pepperwood, in allusion to its sharp pungent bark, which tastes like a *Capsicum*, *Berberis glauca*, *Gentiana corymbosa*, and *Swertia plantaginea*.

Crossing the plain of Bogota to the south west and passing the Paramo de San Fortunato, where I found *Cestrum buxifolium*, *Siphocampylus asper*, *Baccharis microphylla*, *Lupinus bogotensis* and the shrubby *L. interruptus*, I descended to the more temperate regions towards Fusagasuga and Pandi; here among *Araçeæ* and *Piperaceæ*, I found *Fuchsia verrucosa*, a dwarf shrub with small scarlet flowers, *F. hirtella*, whose slender half-climbing stems elevate themselves to the height of 25 feet, seeking support from other shrubs, *Siphocampylus hispidus*, *Centropogon oblongus*, *Calycophyllum coccineum*, a shrub with large scarlet bracts, *Cinchona nitida*, a middle sized tree with a panicle of white sweet scented flowers resembling a Lilac, *Ficus prinoides*, or *India rubber-tree*, *Vernonia rubricaulis*, *Stevia compacta*, several species of *Ferns* and some *Orchidaceæ*, amongst which were the tall-growing *Cyrtopodium punctatum*, and the large crimson flowering *Cattleya maxima*.

On my journey to ZYPAGUIRA (celebrated for its inexhaustible salt-mine), and from thence to PACHO, I observed *Symplocos Alstonia*, *Alnus ferruginea*, *Tagetes zypaguirensis*, *Castilleja fissifolia*, *Viburnum triphyllum*, and *molle*, several *Melastomaceæ*, and *Orchidaceæ*, among which were an *Oncidium* with a twining flower stem, and *Odontoglossum crispum*, having a spike two and a half feet in length, and producing from 20 to 27 large white flowers, with a pinkish hue on the outside of the sepals, and orange spots on the lip.

Having here received instructions to return to Europe with my collections, I left Bogota about the middle of April for HONDA, where I was to embark in the Magdalena. A few days' delay at GUADUAS, occasioned by the difficulty of procuring fresh mules, afforded me an opportunity of examining the flora; here I pro-

cured *Rondeletia brevipes*, *reflexa*, *eriantha*, *Mikania leiostachya*, and *caudata*, *Daphne cestrifolia*, with yellow berries which are poisonous to cattle, *Spigelia hamelioides*, and *Brownea*, the latter forming a tree with large heads of crimson flowers which develop themselves for several weeks in succession. Ascending the wooded heights in the East, I found in a forest of the *Wax Palm*, (*Ceroxylon andicola*), *Gustavia speciosa*, *Caliphruria Hartwegiana* a bulbous plant with white flowers, *Peristeria elata* and *Achimenes picta*, which is another valuable addition to that interesting genus. In its native habitat this *Achimenes* prefers dry rocky ground, in places not much shaded, where it scarcely attains more than five inches in height, seldom producing above two or three of its finely mottled bright orange flowers upon a stem. The accompanying figure was taken from one of the first specimens that flowered in the garden of the Horticultural Society.

Soon after my arrival in Honda, having readily procured a boat capable of holding my collections, I embarked on the *Magdalena* for Barranca, and crossed from thence by land to Carthagena. The rapid descent on the *Magdalena* afforded me but little opportunity of examining its wooded banks, for the boatmen being hired to convey me to my place of destination, it was their interest to make the journey with as little delay as possible.

Finally leaving the mainland about the middle of May for Jamaica, where, during some days delay, I added a few things from the Port Royal mountains to my collection, I embarked for London on the 3rd of June, and arrived safely on the 24th of July 1843, after an absence of six years and ten months.

The following is a list of the plants, as far as their names can at present be ascertained, that have been introduced from Columbia :

Achimenes picta
Angelonia salicariæfolia
Brownea Ariza

Canna glauca
Catasetum latilabre
 — *ochraceum*

Caliphruria Hartwegiana
 Cattleya maxima
 Ceratostemma Salapa
 — lanceolatum
 Ceroxylon andicola
 Cereus sepium
 Conium Arracacha
 Cyrtopodium punctatum
 Epidendrum ceratistes
 Gesnera Lindleyana
 — visita
 Habrothamnus cyaneus
 Helcia sanguinolenta
 Ipomæa codonantha
 Liparis elata
 Lupinus bogotensis
 — arvensis
 — interruptus
 — pubescens
 — ramosissimus
 — semperflorens
 — Tauris
 Lycaste lanipes
 Maxillaria bractescens
 — scabrilinguis

Musa (Pacífico)
 Odontoglossum crispum
 Oncidium rupestre
 Peristeria elata
 Phædranassa chloracra
 — obtusa
 Pilumna laxa
 Rubus glaucus
 Stanhopea Bucephalus
 Stenomesson aurantiacum
 — Hartwegii
 Tacsonia manicata
 — mollissima
 Thibaudia floribunda.

From Jamaica :

Aristolochia grandiflora
 Bletia hyacinthina
 Calanthe veratrifolia
 Crinum Commelini
 Epidendrum fuscatum
 Garrya Macfadyenii
 Hymenocallis Barringtoniæ
 Oncidium luridum.

Mean Height of the Barometer in 1842.

Mean and Extremes of Temperature, and Mean of the Dew Point in 1842.

Monthly depth of Rain in 1842.

VII. *Journal of Meteorological Observations made in the Garden of the Horticultural Society at Chiswick during the year 1842.*
By Mr. ROBERT THOMPSON.

This Journal has been kept on the same plan as the preceding.

JANUARY.

Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	46	26	56	23	NW	Little		<p>The mean temperature was about the average. The barometer averaged a little higher than usual; and the quantity of rain was somewhat less. South winds were prevalent. It is well known to be very generally the case that south and south-west winds occasion a low state of the barometer; but a remarkable instance of the contrary occurred in the period between the 12th and 17th inclusive, the barometer being then very high, with the wind from south and south-west. It was even brisk from south on the 11th and two following days.</p> <p>Mean Pressure from the 3 daily observations 29.942 inches. — Temperature Ditto 41°.76 — Dew Point Ditto 40°.69 — Degree of Dryness Ditto 1°.07 — Degree of Moisture .. Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	51	32	51	28	N	Little	.02	<p>This was a very dry month; in fact the driest of any for the last sixteen years at least. A small quantity of rain fell on the 13th, and only slight depositions on four other days. With the exception of one day, the wind was either from north, or from easterly points throughout the whole of the month. The heat of the sun's rays was considerable; but their effect was greatly counteracted by winds from cold quarters, as above mentioned. Sharp frosts occurred on the nights of the 4th, 5th, 8th, 19th, and even so late as the 27th. These, with the dry cold winds, were unfavourable to vegetation, especially as the latter was rendered susceptible from having been previously far advanced. The 16th was very clear, with Aurora Borealis at night.</p> <p>Mean Pressure from the 3 daily observations 30.022 inches. — Temperature Ditto 46°.83 — Dew Point Ditto 40°.36 — Degree of Dryness ... Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	73	44	80	40	W	Brisk		<p>This month was more favourable than the preceding for vegetation, with the exception of a frost on the night of the 2nd. This frost affected the late blossoming kinds of fruit trees to some injurious extent, the young fruit, where set, being at the same time tolerably safe. Rain was much wanted; and a moderate supply fell in the course of the month. The mean temperature was about 1½ deg. below the average. On the 1st and 2nd the air was clear and excessively dry.</p> <p>Mean Pressure from the 3 daily observations 29.903 inches — Temperature Ditto... 56°.15 — Dew Point Ditto... 50°.43 — Degree of Dryness..... JUNE.

Temperature.					Wind.		Rain.	Remarks.																
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	76	56	86	53	SW	Brisk		<p>This was the hottest June since 1826. That was also a dry month; and no rain fell in the present till the 18th. The mean temperature was nearly 3° above the average, fully equaling the usual temperature of July. On 12 days the thermometer indicated as high as 80°, or between that and 90° in the shade. It was 89° on the 11th and 90° on the two following days, although north-east winds were prevalent at the time. The temperature was lowered by the rain; but towards the end of the month it again reached above 80° in the shade. Vegetation was much checked by the drought; but it started most luxuriantly when rain began to fall, there being a great heat in the ground.</p> <p>Mean Pressure from the 3 daily observations 29.992 inches.</p> <p>— Temperature Ditto 67°.02</p> <p>— Dew Point Ditto 58°.40</p> <p>— Degree of Dryness ... 	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	70	50	86	47	W	Little	.05	<p>It was remarked that in the preceding month the mean temperature was so much higher than usual, that it more than equalled the average of July. In the present month the temperature, on the contrary, was so much lower than usual as to correspond with the usual mean of June. The amount of rain was nearly an inch below the average.</p> <p>The 4th was boisterous at night; the 20th was showery, with lightning at night. Lightning and rain occurred likewise on the night of the 27th. Early on the morning of the 28th, there was much thunder, lightning and rain; the storm became most violent between 5 and 6 A.M.</p> <p>Mean Pressure from the 3 daily observations 29.941 inches. — Temperature Ditto..... 62°.93 — Dew Point Ditto..... 57°.57 — Degree of Dryness Ditto..... 5°.36 — Degree of Moisture.... AUGUST.

Days.	Temperature.				Wind.		Rain.		Remarks.																
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.																	
1	72	43	80	38	NE	Little			<p>This month was excessively hot, the temperature exceeding that of any corresponding month for at least 16 years previous. The maximum temperature in the shade averaged nearly 80°. On the 10th, with a very dry state of the air, the thermometer indicated 93° in the shade, and on the 15th and 18th, 92°. The excessively hot and dry condition of the air on the 10th was followed by slight rain, with distant thunder in the afternoon, and a heavy thunder storm towards midnight, with rain in torrents, more than an inch having fallen. The 24th and 25th were hot and sultry with thunder, lightning, and rain at nights. On the 29th heavy thunders commenced early, A. M. followed by bright sunshine with a few large drops of rain occasionally; and a violent thunder storm with heavy rain in the afternoon.</p> <p>Mean Pressure from the 3 daily observations 29.993 inches.</p> <p>— Temperature.....Ditto..... 67°.27</p> <p>— Dew Point.....Ditto..... 61°.93</p> <p>— Degree of Dryness....Ditto..... 5°.34</p> <p>— Degree of Moisture...Ditto..... .839</p> <p>— Force of Vapour.....Ditto..... .592 inch.</p> <p>Least observed degree of Moisture..... .453</p> <p>Maximum Temperature in the Shade.... 93°.</p> <p>Minimum Temperature in ditto..... 43°.</p> <p>Maximum Temperature in the Sun 120°.</p> <p>Minimum of Terrestrial Radiation 38°.</p> <p>Mean Temperature of External Air 66°.27</p> <p style="text-align: center;">WINDS.</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td>North</td> <td>1 days</td> <td>N. SEPTEMBER.

Temperature.					Wind.		Rain.		Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	66	58	66	58	SW	Little		.46	<p>This was rather a wet month. An average temperature was however fully maintained. On the 1st there was constant rain, with southwest wind, the temperature rising instead of falling towards night; and on the following day the thermometer indicated 81° in the shade. On the 7th a violent thunder storm occurred between 7 and 10 P.M. with much sleet and occasionally forked lightning, heavy rain and some hail.</p> <p>In consequence of the heat and moisture in this month, many kinds of vegetation previously checked had now a tendency to grow rather than mature their wood and fruit. Thus apples and pears were checked in their earlier stage of growth; and they increased considerably in size in this month, when they ought to have ripened off.</p> <p>Mean Pressure from the 3 daily observations 29.811 inches.</p> <p>— Temperature Ditto 58° 58</p> <p>— Dew Point Ditto 56° 81</p> <p>— Degree of Dryness Ditto 1° 77</p> <p>— Degree of Moisture .. OCTOBER.

Days.	Temperature.				Wind.		Rain.		Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	59	31	95	27	NE	Brisk			<p>A great depression of temperature took place in this month, the mean being nearly 6° below the average. The wind set in from north-east on the 24th of last month, and continued almost constantly in the same direction till the 18th of the present. An unusually cold month appears to have been the consequence. Frosts set in as early as the 1st; and twelve frosty nights were indicated by the common thermometer, and twenty by the radiating one. On the night of the 21st the frost was remarkably severe for the period of the season, the thermometer being 12° below the freezing point, whilst the radiating thermometer sunk to 12°, or 20° below freezing. The beauty of the Dahlias and other similarly tender flowers was then of course completely spoiled for the season. No rain fell till the 18th, the barometer standing high; but the wind then became variable for a few days, and afterwards set in from the south-west, when the barometer fell exceedingly, and was remarkably low on the 23rd, about which time rain fell heavily.</p> <p>Mean Pressure from the 3 daily observations 29.954 inches</p> <p>— Temperature Ditto 46°.85</p> <p>— Dew Point Ditto 44°.41</p> <p>— Degree of Dryness ... NOVEMBER.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sur.	Rad.	Direction.	Force.	In. Pts.									
1	55	32	65	28	W	Little		<p>The weather in this month was almost constantly wet and frequently very boisterous. Frosts were of less frequent occurrence than in the preceding month and they were also less severe. Nearly 4½ inches of rain fell, being almost double the usual quantity for the month. The barometer was frequently very low, and more especially so in the last week. On the 24th, the depression was greater than at any other period of the year; the day was fine, but there were lightning and heavy rain at night.</p> <p>Mean Pressure from the 3 daily observations 29.680 inches — Temperature.....Ditto..... 43°·94 — Dew Point.....Ditto..... 43°·12 — Degree of Dryness.....Ditto..... 0°·82 — Degree of Moisture.....Ditto..... .938 — Force of Vapour.....Ditto..... .317 inch. DECEMBER.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	54	52	55	51	S	Brisk	.01	<p>The weather was remarkably mild for the period of the season. Very little rain fell, and there were only a few slight frosts; so that, on the whole, this may be considered the finest December that has been experienced for many years. The nights averaged nearly 4° warmer than those in October of the present year. The wind was 2 days from south-east; and during all the rest of the month, it was from the warm quarters of South, South-west, and West.</p> <p>Mean Pressure from the 3 daily observations 30.082 inches. — Temperature Ditto 44°.18 — Dew Point Ditto 44°.02 — Degree of Dryness Ditto 0°.16 — Degree of Moisture Ditto994 — Force of Vapour Ditto328 inch. VIII. *On the Exhaustion of Soils.* By EDWARD SOLLY, Esq.,
F. R. S., F. L. S., Hon. Memb. Roy. Agr. Soc. Eng. Experimental Chemist to the Horticultural Society.

(Communicated by the CHEMICAL COMMITTEE.)

ALTHOUGH it is well known that some plants take more from the soil than others do, some requiring a large quantity of inorganic matters, such as Alkalies and the earthy Phosphates, whilst other plants require a comparatively small quantity, and hence in growing do not exhaust or impoverish the soil to so great an extent; yet there are many points connected with the subject, and having immediate reference to practical operations, which are by no means so clear as could be wished. The following observations relate to one of these questions in particular, viz. what is the maximum and minimum of exhaustion, for any given plant. In a previous paper it has been shown, that the same plant grown in the same soil but differently manured, exposed to the influence of particular substances, or placed under different conditions, contains variable proportions of inorganic matter. This naturally leads to the question of how far these conditions are under our controul, because if they are so to any extent, it is evident that that mode of cultivation must be most desirable, in which the largest amount of vegetable matter is formed, at the least expence of inorganic matter.

The plant selected for some experiments on this subject was the Red Mangel Wurzel, which was cultivated in rich soil, abundantly supplied with animal manure. A fair average plant was examined

from week to week, to note the ratio existing between the vegetable matter formed, and the inorganic matter abstracted from the soil. In the early part of the experiment the rate of growth was very regular, so that by weighing a few plants from time to time the increase in weight of the roots every day might be readily ascertained. The experiment was commenced in July when the roots weighed about 3 oz. each, and were then increasing at the rate of nearly an ounce a day; this rate of increase appeared to continue pretty regularly, for about six weeks, after which the plants grew far less regularly, an effect in part due to the unsettled state of the weather. The following Table shows the composition of the roots examined, during fifteen consecutive weeks, and also the composition of the seeds previous to germination.

Composition of Red Mangel Wurzel Seed previous to germination.	Water.			Organic matter.			Inorganic matter.			Inorganic in 10000 pts. dry seed.

The results of this series of experiments exhibit less regularity than might have been expected; the conclusions to be drawn from them as regards the degree of exhaustion are arranged in the following Table.

	Roots.		Leaves.	
	Inorg. matt. in 10000 parts dry.	Organ. matt. = 100 parts inorganic.	Inorg. matt. in 10000 pts. dry.	Organ. matt. = 100 parts inorganic.
1st week	1354	639	2409	314
2d Do.	987	919	2301	335
3d Do.	1134	787	1497	572
4th Do.	760	1234	2533	294
5th Do.	1067	837	2186	359
6th Do.	1565	542	2689	265
7th Do.	1209	728	2913	243
8th Do.	1486	575	2713	269
9th Do.	1203	732	2024	397
10th Do.	1220	722	2102	375
11th Do.	784	1169	2311	302
12th Do.	1025	926	2592	285
13th Do.	1015	990	2389	320
14th Do.	1129	786	1316	661
15th Do.	876	1144	1748	472

It is worthy of note that in examining this series of plants it was observed that the young roots for the first two weeks contained small traces of Nitric acid, whilst for the three first weeks the leaves contained a very large quantity; in the third and fourth week the roots contained a considerable portion of Nitric acid, but after that little or none could be detected; from the fourth to the eleventh week the leaves also contained a considerable quantity, but during the three last weeks of the experiment the leaves like the roots were quite destitute of any Nitrates.

At the same time with these experiments a similar examination was made of the experimental Mangel Wurzel roots, which formed the subject of the experiment already described (p. 86 of this volume). The following is the relative composition of this series of plants.

Manure applied.	Water.	Organic matter.	Inorganic matter.	Inorg. matt. in 10000 parts dry.
1. Muriate of Lime	9075	837	98	1092
2. Phosphate of Ammonia	9090	817	93	1029
3. Sulphate of Potash	9032	854	114	1185
4. Muriate of Ammonia	9085	814	101	1110
5. Nitrate of Potash	9014	889	97	984
6. Common Salt	8991	911	98	975
7. No Manure	8858	1027	115	1014
8. Muriate of Potash	8935	972	93	878
9. Nitrate of Soda	9064	838	98	1047
10. Sulphate of Magnesia	9039	850	111	1163
11. Sulphate of Soda	9154	742	104	1242
12. Superphosphate of Lime	9332	568	100	1496
13. Carbonate of Soda	8941	963	96	917
14. Sulphate of Ammonia	9142	766	92	1076
15. Phosphate of Soda	9179	712	109	1326
16. Rotten Dung	8945	947	108	1024

By comparing these numbers with those already given (p. 86), as expressing the weights of the several crops, it is easy to calculate the relative value of each crop as expressed by the effect produced in deteriorating the soil. Hence we at once get a reply to the question, whether the largest crop exhausts the soil more, or less, than the smaller ones, in proportion to the amount of food or vegetable matter formed. This is shewn in the following Table which contains the weight of the crop per acre, the quantity of inorganic matter removed from the soil by each crop, the quantity of dry organic matter equivalent to 100 parts of the inorganic matter thus abstracted, and the assumed effect produced by each crop, arranged in the order of their exhausting effects.

	Weight of Crop. cwt.	Inorg. matter in Crop. lbs.	Dry. organic matt=100 pts. inorg.	Assumed relative exhaustion.
12. Superphosphate of Lime	530	594	568	1839
15. Phosphate of Soda .	513	626	653	1583
11. Sulphate of Soda .	647	753	713	1465
3. Sulphate of Potash .	754	963	749	1395
10. Sulphate of Magnesia	627	929	765	1366
4. Muriate of Ammonia	658	745	805	1298
14. Sulphate of Ammonia .	457	471	832	1256
1. Muriate of Lime .	939	1032	854	1223
9. Nitrate of Soda .	682	682	855	1222
16. Rotten dung . . .	676	820	876	1192
2. Phosphate of Ammonia	715	745	878	1190
7. No manure . . .	617	805	892	1171
5. Nitrate of Potash .	736	800	916	1140
6. Common salt . . .	774	850	929	1124
13. Carbonate of Soda .	653	702	1031	1001
8. Muriate of Potash	696	725	1045	1000

It is evident then from this Table, that the rate of exhaustion is quite independent of the weight of the crop. Thus for example, taking Phosphate of Ammonia as a standard of comparison, it appears that Sulphate of Ammonia produced a smaller, and Muriate of Lime a larger crop; yet, both of these crops exhausted the soil more than the standard, just in the proportion that 1256 and 1223 are more than 1190. Again no manure produced a smaller, and common salt a larger crop, than Phosphate of Ammonia did, but both of them, in proportion exhausted the soil less than the standard in the ratio of 1171 and 1124 to 1190. In arriving at this

conclusion, however, it must be remembered that as the nature of the inorganic substances absorbed by plants, varies as well as their quantity, it does not follow that that plant which takes up most earthy matter does most injury to the soil. It is in fact more probable that the amount of Phosphoric acid taken up by the crop would be a fairer standard of exhaustion; but even this does not seem to be quite accurate in all cases, because though in some experiments it was found that the earthy matter bore a smaller relation to the organic matter, just in proportion to the quantity of Phosphoric acid it contained; yet there were so many exceptions to this rule, as to render its applicability very questionable.

Previous experiments had made it appear probable that some relation existed between the rapidity of growth, and the proportion of earthy matters existing in the plants. In the experimental Peas (p. 86) very little effect was produced by the various manures employed; Common Salt and Nitrate of Soda slightly improved the growth of the plants, they were rather larger and more flourishing than the other ten squares, but the produce in seed was rather less. In July, when the seeds were fully formed, but still quite soft and green, they were examined; the following Table shews their composition, and the relation of inorganic to organic matter at this time.

	Water.	Organic matter.	Inorganic matter.	Inorg. matt. in 10000 parts dry.	Organicmatt. = 100 parts. inorg. dry.	Assumed relative exhaustion.
Nitrate of Soda	7383	2526	91	347	2775	1228
Phosphate of Ammonia	7288	2625	87	323	2982	1142
Muriate of Ammonia	7068	2838	94	323	2987	1140
Sulphate of Potash	7105	2803	92	319	3025	1126
Sulphate of Soda	7080	2830	90	317	3052	1116
Common Salt	7042	2868	90	312	3105	1097
Phosphate of Lime	7135	2778	87	306	3160	1078
Sulphate of Lime	7180	2735	85	309	3190	1068
Muriate of Potash	6893	3013	94	303	3195	1066
No manure	7073	2837	90	308	3300	1032
Sulphate of Magnesia	6639	3264	97	289	3360	1014
Sulphate of Ammonia	6921	2992	87	285	3408	1000

Three months later, when the Peas were perfectly ripe, and had been gathered in and weighed, they were a second time examined;

and though still very uniform in composition, the proportion of inorganic matter, differed a good deal from that in the green Peas. The results of this second series of experiments, which bear more immediately on the subject of inquiry, are contained in the following Table.

	Ripe Peas.						
	Water.	Organic matter.	Inorganic matter.	Inorg. matt. per 10000 pts. dry.	Crop, per acre.	Dry organic matt. = 100 pts. inorgan.	Assumed relative exhaustion.
Common Salt	1110	8610	280	316	cwt. 17 lbs. 76	3063	1127
Sulphate of Lime	1057	8670	273	305	18 75	3171	1092
Nitrate of Soda	1090	8640	270	303	16 54	3200	1079
Sulphate of Soda	997	8833	270	299	18 64	3234	1068
Phosphate of Lime	957	8777	266	295	21 84	3291	1049
Sulphate of Potash	1044	8693	263	294	19 19	3301	1046
Muriate of Ammonia	1014	8723	263	293	22 61	3312	1043
Sulphate of Ammonia	1000	8737	263	292	19 52	3317	1041
No manure	927	8810	263	292	21 104	3345	1032
Sulphate of Magnesia	1024	8716	260	291	18 97	3352	1030
Phosphate of Ammonia	860	8880	260	248	18 31	3415	1011
Muriate of Potash	874	8870	256	281	21 51	3455	1000

From this Table it is clear that the crops which at first grew most vigorously, and seemed most benefited by the manures, namely, those to which common Salt and Nitrate of Soda had been applied, absorbed in consequence a considerably larger proportion of earthy matters; as from the numbers in the last column it appears, that in those plants the relation of inorganic to organic matter, is higher than in most of the others. The experiments already described on Mangel Wurzel are on the other hand opposed to this view, and the following examination of the Experimental Potatoes likewise leads to very different conclusions, because in place of finding that those plants which grew most vigorously, or yielded the largest return of produce, contained most inorganic matter, we find that set of plants which grew most luxuriantly and produced the largest crop, was also that in which the smallest proportion of inorganic matter was contained; a result which is further borne out by the experiments on Potatoes, of the previous year, described at p. 48.

	Potatoes.						
	Water.	Organic matter.	Inorganic matter.	Inorg. matt. in 10000 parts dry.	Crop, per acre.	Dry organic matt. = 100 parts inorg.	Assumed relative exhaustion.
Sulphate of Ammonia	7315	2527	158	590	cwt. 289	1594	1412
Common Salt .	7508	2345	147	570	302	1654	1360
Nitrate of Soda .	7636	2237	127	540	309	1751	1285
Sulphate of Soda .	7590	2280	130	540	266	1751	1285
Sulphate of Lime	7568	2305	127	525	231	1804	1248
Muriate of Potash .	7679	2200	121	525	300	1804	1248
Sulphate of Magnesia	7613	2271	116	500	279	1900	1185
Phosphate of Ammonia	7504	2374	122	490	262	1940	1160
No manure .	7724	2166	110	485	227	1961	1140
Phosphate of Lime	7668	2223	109	470	257	2021	1113
Sulphate of Potash .	7695	2199	106	460	241	2073	1081
Muriate of Ammonia	7743	2164	93	425	341	2252	1000

In experiments of this kind, considerable variations have been found in the composition of the inorganic substances which plants contain, when thus cultivated under different circumstances; and therefore we must not at once conclude that such results are rigorously correct. From these, however, and a number of other experiments, I have no doubt that a large and healthy crop does really in proportion exhaust the soil less than a smaller and less flourishing one; nay, even, that under certain circumstances a moderate crop will take more out of a soil, or be more exhausting to it, than a larger one.

Bedford Row,
15th January, 1845.

IX.—*On Seed-Steeping.* By EDWARD SOLLY, *Esq., F. R. S., F. L. S., Hon. Memb. Roy. Agr. Soc. Eng. Experimental Chemist to the Horticultural Society.*

(Communicated by the CHEMICAL COMMITTEE.)

FROM very early times it has been a favourite idea with the followers of husbandry, that the produce of the ground might be greatly increased by causing the seed to undergo some process of preparation previous to its being sown. On looking over the various writings of those who have made agriculture their study, one cannot but observe how very frequently, great importance is attributed to the preparation of the seed; and considering the multitude of books which have been written, and the number of experiments made by succeeding generations, it is not a little remarkable that even at the present day it should still be open to inquiry whether the steeping or preparation of the seed, does or does not, to any extent supply the necessity of manure. We are told by Virgil;

*Semina vidi equidem multos medicare serentes,
Et nitro prius, et nigrâ perfundere amurcâ,
Grandior ut fœtus siliquis fallacibus esset.*

and we are told at the present time that by steeping the seeds of corn, &c., in certain solutions, of nitre and other salts, a small quantity will be absorbed, which will greatly increase the vigour and luxuriance of young plants, and ensure without further manure a much larger and more plentiful harvest, than could possibly be obtained without the previous steeping.

I will not attempt to give any sketch of what has been written on the subject of seed-steeping, which would necessarily lead to long and tedious details, but I shall content myself with a few brief

quotations from the writings of some of the most ingenious men of their times, as an introduction to my own experiments.

The writings of many of the agriculturists of the seventeenth century display a remarkable spirit of inquiry, associated with a correctness of reasoning, hardly to be expected in such early days, and almost free from the narrow-minded fear of innovation which characterises many of the writers of the last century. In the writings of Plattes for example, there are suggestions which may be studied with advantage even at the present day. The following remarks on the steeping of seeds are from his "Discovery of hidden Treasure," published in 1639, and follow some good observations on liquid manure. "When the sun hath exhaled the greater part of the dung-water, and that it groweth thickish and fat, then reserve a good pit full thereof well bottomed with clay, that will hold water, and at seed-time steep your seed-corn in it, but put the fat water to it by little and little as it drinketh it up; that at the last it may be almost dry of itself: but before it be full dry, sift a small quantity of lime amongst it, that so it may grow dry with the lime, and grow like comfits, then with this seed sow or set your most remote ground from your dunghills, and by this means you will save ten times as much labour in carriage of your dung, so far as this labour cometh too, and as for your crop, though you shall not have so much increase as some, have mountebanklike reported of it, yet you shall have a good material increase, for one crop only.

"And I have sometimes spritted the corn a little, as they use to do for malt, and then have sown it, and it came up speedily and got the predomination of the weeds at first, and so kept the same, whereby I had far greater increase than ordinary. Also I found sometimes when a dry season came upon the sowing, that my corn thus ordered took root far better than other mens' corn who would not take this small pains to steep it and sprit it."

About this period attention was drawn to seed-steeping by Lord Bacon, who made a number of experiments on the subject, which

possess considerable interest. The following account of them is from the fifth century of his *Sylva Sylvarum*, or *Natural History*, published in 1664, after his death.

“ There were sown in a bed turnip seed, raddish seed, wheat, cucumber seed, and peas. The bed we call a hot bed, and the manner of it is this. There was taken horse-dung, old and well rotted; this was laid upon a bank half a foot high, and supported round about with planks, and upon the top was cast sifted earth some two fingers deep, and then the seed sprinkled upon it, having been steeped all night in water mixed with cow-dung.

“ The turnip seed and the wheat came up half an inch above ground within ten days after, without any watering: the rest the third day. The experiment was made in October; and it may be, in the Spring the acceleration would have been the speedier. This is a noble experiment, for without this help they would have been four times as long in coming up. But there doth not occur to me at this present, any use thereof for profit, except it should be for sowing of peas which have their price very much increased by the early coming. It may be tried also with cherries, strawberries, and other fruit which are dearest when they come early.

“ There was wheat steeped in water mixed with cow-dung; others in water mixed with horse-dung; in water mixed with pigeon's dung; in human urine; in water mixed with chalk powdered; in water mixed with soot; in water mixed with ashes; in water mixed with bay salt; in claret wine; in malmsey wine; and others in spirit of wine. The proportion of the mixture was a fourth part of the ingredients to the water, save that there was not of the salt above one-eighth. The urine, wines, and spirit were simple, without mixture of water. The time of steeping was twelve hours, the time of the year October. There was also other wheat sown unsteeped but watered twice a day with warm water. There was also other wheat sown simple to compare with the rest. The event was that those which were in the mixture of dung, urine, soot, chalk,

ashes, and salt came up within six days, and those that afterwards proved the highest, thickest, and most lusty, were first the urine, then the dungs, next the chalk, next the soot, next the ashes, next the salt, next the wheat simple, next that watered twice a day with warm water, next the claret wine. So that those three last were slower than ordinary wheat itself, and this culture did rather retard than advance. As for those that were steeped in malmsey and spirit of wine, they came not up at all. This is a rich experiment for profit; for the most of the steepings are cheap things and the goodness of the crop is a great matter of gain; if the goodness of the crop answer the earliness of the coming up, as it is like it will; both being from the vigour of the seed, which also partly appeared in the former experiment, as hath been said."

The experiments of Bacon and the good opinion which he seems to have had of the value of seed-steeping caused many to take up the subject; various solutions were recommended; and as various was the success which attended their use. The following cautious observations of Blith (1649), are interesting in connexion with the preceding account of Bacon's experiments.

"Sir Francis Bacon is of opinion that salt mingled with corn hath a very good operation, being sowed with the corn, which possibly may, because brackishness is fruitful to the land, also that chalk and lime sowed with the corn is very helpful and that steeping of your corn in fat water, lime-water, or dunghill-water, hath a wonderful effect to work strange things, of all which myself having not made full experience, can find no more advantage therein than just so much as is added to the corn either of the chalk or lime in substance, or so much as is added of the soil or fatness of either of the waters and no more. For having made a thorough trial thereof found no otherwise, nor nothing of that great advantage promised; but let me not prejudice any ingenious trials of the same, others may find more, possibly I might miss in the manner of my application."

On reading over the opinions of those who stated that they had tried the process of seed-steeping, it will be observed that they are for the most part unfavourable, though generally qualified by a modest doubt of the accuracy of their conclusions, and the decisiveness of their experiments. This is illustrated in the observations of Blith, and also in the following remarks of Sir Hugh Plat (1653). "Now a word or two of those conceited practices, which I promised before. I have heard some student practisers very confidently affirm, that if you steep your corn in water, the space of certain hours (but I could never yet find them all agree in one time; for some limit, twelve hours, some eighteen, and some thirty-six hours, you may prove them all and keep the best) in water, wherein good store of cow-dung hath lain in imbibition for certain days, (which times you must also search, if you mean to be an exact master) every day stirring the same once or twice together before you lay in your corn, and after this preparation you sow the same (though in barren ground) that so you shall purchase a most rich and plentiful crop with an easy charge. But this kind of practice, I have heard both maintained and impugned as well by reason as by experience, and that by men of good judgment on both sides, although if I would set down my own experience herein, I must needs confess I could never yet attain to any truth in this secret, or to make any apparent difference between the corn that was husbanded in this manner and that which grew of itself without any such help (yet will I not for the credit of the reporters) altogether discredit the invention, for that peradventure I might fail in the nature of the grain or in the time of imbibition."

He then proceeds to relate a successful experiment in which corn was mixed with dung and water, the whole being well stirred together for one hour; after standing some hours it was again stirred for half an hour, and then left at rest all night. On the following morning the water was permitted to drain away, and the corn and dung together then sown on very poor barren soil; the crop

obtained was most plentiful, as if the ground itself had been well manured. This experiment however can hardly be fairly classed amongst those on seed-steeping, though at the same time it is probable that the effects produced were in great part similarly caused to those which from time to time have been produced by mere steeping.

Within the last three or four years public attention has been again drawn to the subject of seed-steeping by reports of the wonderful crops obtained from steeped seeds. In Germany M. Bickes and M. Victor, and Mr. Campbell in our own country, have described the surprising effects on vegetation produced by various steepings; indeed, the accounts published by the German authors are so marvellous, and the deductions made by them from the results of their experiments so startling, that they could not fail to excite curiosity and induce experiment, though on consideration we feel assured that the authors must have either been greatly deceived themselves, or willing to exaggerate their results a little in order to excite the attention of their readers. The experiments of these authors are so well known that it is unnecessary here to recapitulate them further, than to observe that the principle put forth was the same as that advanced so long since by Bacon and others, that by manuring the seed previous to sowing it, a far better harvest would be obtained; the plants would grow with greater vigour and luxuriance, and in consequence would be less liable to blights and the ravages of insects. Some of the recent advocates of seed-steeping have gone much further than this, and have asserted that by properly preparing the seed, it may be made to absorb such a quantity of those substances which growing plants require, that, when placed in the ground it will contain within itself such a store of inorganic food, as to be quite independent of the soil, and therefore in growing not exhaust the latter at all.

The object, contemplated in the following series of experiments made at the Garden of the Horticultural Society in the Spring of

1844, was to ascertain whether any and what effect would be produced by steeping various seeds in certain simple solutions previous to sowing, and to submit the plants subsequently to chemical examination should any differences be observed which might render such a proceeding desirable.

The ground selected for the experiments was uniform and had not been previously used for chemical experiments, its composition was very nearly the same as that of the ground employed in the experiments of last year (see p. 36 of this volume). The seeds were all good, being selected on purpose, and the whole of each kind of seed was sown at the same time. Saturated solutions of pure nitrate of soda, chloride of calcium, sulphate of magnesia, muriate of ammonia, phosphate of ammonia, and common salt were made, and these diluted by the addition of nine times as much pure water; enough of each steep was taken to cover entirely the portion of seeds to be steeped, the quantity of solution being invariably two fluid ounces; the seeds were left in the solution until they had swelled considerably, and it became evident that in a little time more they would sprout, when they were withdrawn from the solutions, drained on paper, and then sown. During the whole time of steeping they were kept in the dark. Besides the six portions of seeds steeped in the above mentioned solutions, two others were sown, one of which had been soaked a corresponding time in water alone, and one which had not been steeped at all; thus the effect would be observed, of steeping in water alone as distinguished from the additional effect produced by each salt employed. The beds intended for each particular sort of seed were divided into forty rows, and each of the eight parcels of seed was subdivided into five portions, so as to allow one to each row. Thus the first eight rows received each of them a portion of the same sort of seed differently prepared, the series of eight being repeated five times over, the first, ninth, seventeenth, twenty-fifth, and thirty-third row containing seeds similarly prepared; each row having in fact four more rows like itself, but separated from each

other as widely as possible, so as to ensure fair average results by diminishing the chance of any local circumstances interfering with the experiments. Each row contained thirty seeds, so that there were 150 seeds of each sort, for each steep; the seeds were sown early in April. The experiment was under the care of Mr. Thompson.

1. WHEAT. At first these seeds exhibited considerable differences in the time required for germination, after a little time, however, they came up pretty generally but grew irregularly, and did not form good ears, the following table shows the number of young plants up:

	Eleven Days after Sowing.					Total.
Nitrate of Soda	0	3	2	1	1	7
Chloride of Calcium	0	4	1	1	4	10
Sulphate of Magnesia	11	4	3	4	8	30
Muriate of Ammonia	0	4	1	1	3	9
Nothing	3	1	3	1	4	12
Phosphate of Ammonia	7	1	2	11	9	30
Water	0	1	2	2	3	8
Common Salt	2	2	1	3	0	8

2. BARLEY. The experiments with barley succeeded better than those with wheat, two of the solutions appeared to have done some good, for the seeds steeped in them at first had rather the advantage over the others; this difference, however, very soon disappeared, and in a short time when the plants had attained a height of six inches no difference could be perceived. The plants spread and formed abundance of ears, the grain in which ripened well, but no marked differences could be perceived amongst them:

	Ten Days after Sowing.					Total.	Twelve Days after Sowing.					Total.	Whole Produce.		Grain.		Straw.	
													lb.	oz.	lb.	oz.	lb.	oz.
Nitrate of Soda	0	0	1	1	0	2	0	3	3	1	2	9	8	7	3	1	4	11
Chloride of Calcium	0	0	0	0	3	3	0	5	3	3	5	16	7	12	3	0	4	1
Sulphate of Magnesia	12	4	3	1	3	23	17	4	4	6	9	40	7	13	3	4	4	2
Muriate of Ammonia	0	3	1	0	0	4	2	4	1	1	4	12	7	8	3	1	3	12
Nothing	3	0	2	0	1	6	5	2	7	1	5	20	8	9	3	6	4	5
Phosphate of Ammonia	5	1	2	10	8	26	8	1	3	12	9	33	7	12	3	3	3	14
Water	0	1	0	1	2	4	4	4	3	2	4	17	8	3	3	3	4	3
Common Salt	0	0	0	0	0	0	3	2	2	4	0	11	8	7	3	3	4	7

3. OATS. Oats germinated and came up with very great regularity; the following table shows the whole number up in seventeen days after sowing, and also the weight of the crop produced by each steeping:

	Total Young Plants after 17 Days.	Produce.			
		Grain.		Straw.	
		lbs.	oz.	lb.	oz.
Nitrate of Soda	125	1	7	3	4
Chloride of Calcium	120	2	3	5	0
Sulphate of Magnesia	126	1	13	3	15
Muriate of Ammonia	126	2	2	4	3
Nothing	133	1	14	4	1
Phosphate of Ammonia	119	2	1	3	12
Water	128	2	2	4	1
Common Salt	123	1	4	4	5

In this experiment no appreciable difference was perceptible in the time when the different rows of seed came up; they germinated at nearly the same time, and at no period of their growth did the plants exhibit any differences in appearance.

4. RYE. These seeds came up with far more irregularity than the oats, all the steeps more or less retarding the germination of the seeds. As the plants did not shoot into ear regularly, no account of the weight of the produce could be kept. The following table shows the number of plants above ground in the tenth and twelfth day after sowing:

	Ten Days after Sowing.					Total.	Twelve Days after Sowing.					Total.
Nitrate of Soda	0	0	0	0	0	0	0	0	6	7	1	14
Chloride of Calcium	0	4	0	4	1	9	0	7	5	5	3	20
Sulphate of Magnesia	3	4	0	3	8	18	7	5	0	3	14	29
Muriate of Ammonia	0	0	0	0	5	5	2	0	0	0	9	11
Nothing	8	0	8	5	18	39	13	3	13	11	22	62
Phosphate of Ammonia	0	0	2	0	5	7	3	1	4	1	7	16
Water	2	0	0	11	0	13	3	0	4	9	2	18
Common Salt	3	0	0	1	0	4	3	1	0	2	0	6

5. PEAS. Out of the eight series of peas sown only three germinated, the remaining five were evidently destroyed by the steeps.

The three which came up were those not prepared at all, those merely soaked in water, and those steeped in sulphate of magnesia. The following was the result of this experiment :

	Seventeen Days after Sowing.	Green Crops.	Seed.		Straw.	
		lbs.	lbs.	oz.	lbs.	oz.
Nitrate of Soda . . .	0	0	0	0	0	0
Chloride of Calcium .	0	0	0	0	0	0
Sulphate of Magnesia	65	19	4	3	3	6
Muriate of Ammonia	0	0	0	0	0	0
Nothing	94	18	5	2	3	12
Phosphate of Ammonia	0	0	0	0	0	0
Water	106	19	5	7	4	2
Common Salt	1	0	0	0	0	0

6. TURNIPS. The seeds steeped in water were the first to come up. Unfortunately the fly took the greater number of the young plants and destroyed the experiment eight days after sowing. The following were the number of plants up :

Nitrate of Soda	1	Nothing	28
Chloride of Calcium . . .	34	Phosphate of Ammonia	4
Sulphate of Magnesia . . .	34	Water	35
Muriate of Ammonia	11	Common Salt	40

7. MUSTARD and 8. CRESS.

	Mustard.		Cress.	
	Eight Days after Sowing.	Twelve Days after Sowing.	Eight Days after Sowing.	Twelve Days after Sowing.
Nitrate of Soda	0	3	1	2
Chloride of Calcium	6	12	2	8
Sulphate of Magnesia	6	9	7	7
Muriate of Ammonia	1	1	1	2
Nothing	20	20	10	14
Phosphate of Ammonia	0	0	1	2
Water	22	22	5	5
Common Salt	8	12	1	4

9. LETTUCES and 10. BEANS.

	Lettuces.	Beans.
	Twelve Days after Sowing.	Fourteen Days after Sowing.
Nitrate of Soda	25	0
Chloride of Calcium	35	0
Sulphate of Magnesia	30	13
Muriate of Ammonia	27	0
Nothing	21	2
Phosphate of Ammonia	20	1
Water	25	56
Common Salt	39	0

The whole series of experiments was made in rather unfavourable weather, being a period of unusual drought; this greatly checked the germination of the seeds, and in some instances retarded it for some weeks. The beans, No. 10, mostly came up in the course of the following fortnight, but those which had first come up, which had been steeped in water, retained their superiority to the last. The general results of these experiments, as far as they may be trusted, are rather against seed-steeping. As regards the wheat, barley and lettuces, it certainly seems as if the salts employed did accelerate germination, because in two cases, namely sulphate of magnesia and phosphate of ammonia, more than twice as many plants had come up than where no steeping or only water had been employed; we may therefore conclude that in these cases, the salts and not the water, produced the effect which was observed. In all the other experiments, however, the salts appear to have done more or less harm; at least the seeds which were steeped germinated less rapidly than those not steeped in saline solutions. In the case of the oats, peas, and mustard, the unsteeped seeds and those steeped in water alone, germinated most rapidly, the latter rather having the start of the former. In the rye and cress the unsteeped seeds germinated most rapidly, whilst those steeped in water were beaten by some of the saline solutions, and in the turnips and beans, those steeped in water came up first, whilst some of those prepared with saline solutions germinated sooner than the unprepared seeds.

The different salts acted differently on the various seeds employed: thus in the case of wheat and barley, sulphate of magnesia, and phosphate of ammonia, produced the best effect of all the salts employed; with turnips, lettuces and mustard, common salt and chloride of calcium acted best; with peas and beans, sulphate of magnesia had the greatest effect; with rye and cress, chloride of calcium and sulphate of magnesia were most advantageous; whilst with oats, all the salts employed, produced very little effect. It

is remarkable that throughout, nitrate of soda and muriate of ammonia decidedly retarded germination.

In these experiments the seeds were all left in steep the longest time which it was considered could be safely done; as it was however very desirable, also to make trial of the effects of steeping for different periods, the following experiment was made under the superintendence of Mr. Donald. One hundred and twenty-five seeds of *Lupinus Hartwegii* were divided into twenty-five parcels of five each, and each parcel differently prepared previous to sowing. One parcel was kept unsteeped; twelve were steeped for longer or shorter periods in a solution of phosphate of ammonia, formed by mixing one part of the saturated solution of the salt with four parts of water; and the remaining twelve in a solution of just half the strength, consisting of one part of the saturated solution diluted with nine parts of water. The following table shows the result of this experiment, the seeds being all sown on the same day.

Strength of Solution.	Hours in Steep.	Number Raised.	Days after Sowing.	Remarks.
	0	5	2	Very healthy
1 in 5 water . .	6	2	2	Very weak
1 in 5 do. . .	12	2	2	Do. do.
1 in 5 do. . .	18	1	3	Do. do.
1 in 5 do. . .	24	2	3	Do. do.
1 in 5 do. . .	30	1	3	Do. do.
1 in 5 do. . .	36	1	2	Do. do. died 2 days after
1 in 5 do. . .	42	2	4	weak
1 in 5 do. . .	48	2	3	do.
1 in 5 do. . .	52	0		
1 in 5 do. . .	58	0		
1 in 5 do. . .	64	0		
1 in 5 do. . .	168	0		
1 in 10 do. . .	6	3	2	healthy
1 in 10 do. . .	12	1	5	weak
1 in 10 do. . .	18	1	4	do.
1 in 10 do. . .	24	1	3	do.
1 in 10 do. . .	30	0		
1 in 10 do. . .	36	2	4	weak
1 in 10 do. . .	42	1	5	do.
1 in 10 do. . .	48	0		
1 in 10 do. . .	52	0		
1 in 10 do. . .	58	0		
1 in 10 do. . .	64	0		
1 in 10 do. . .	168	0		

This experiment, unlike those previously described, is certainly not in favour of the value of phosphate of ammonia as a steep; it is

however worthy of remark, that of the first series of Lupine seed steeped in the strong solution, 13 came up out of 60, whilst in the second series of those steeped in the weaker solution, only 9 came up out of 60. It is remarkable that the smaller quantity of the salt, seemed to do more harm than the larger.

Two distinct operations are very frequently spoken of under the general name of seed-steeping; the one consists in sinking the seeds in a considerable quantity of some liquid, the excess of which is poured off when it is judged the seeds have absorbed as much as is desirable; the second, when the seeds are soaked in a very small quantity of the solution, not more being used than they are able to absorb, so that there subsequently does not remain any liquid to be drained off, a quantity of dry lime or other powder being sifted upon the seeds and stirred up with them so as to dry the surface partially. It is evident that these two are very different operations and calculated to produce very different effects. By an operation of the first sort, light, blighted, and worthless grains which rise to the surface may be readily separated from the sound seeds, and the eggs of insects may be destroyed, which if sown with the seed might soon hatch and destroy the young plants. In the second process these effects are not attained; the seeds as in the first-mentioned plan absorb a certain quantity of a solution, and in addition are externally coated with a small quantity of lime, or some other dry substance, which in a soil deficient in the substance employed may constitute a useful and valuable manure; whilst at the same time when lime is employed, it will probably defend the seeds from any insects in the soil.

It is evident that the value of any steep or process of preparing seed, will in great part depend on the nature of the soil where the seed is sown, and the weather or peculiar conditions of the season when it is used. It must always be remembered that no process of steeping can possibly replace the use of manure; if by steeping the seed we are enabled to obtain from the soil a larger crop than

we should otherwise have had, it is certain that the crop of the next year will suffer in proportion. The only chemical effect of seed-steeping must be to cause germination to proceed more rapidly and give increased vigour to the young plant, and consequently to require a larger supply of earthy matters from the soil. The experiments made this year at the Gardens of the Society, must be received with some allowance, as having been carried on in a peculiarly unfavourable season; they possess however considerable interest, and as far as they go may be relied on as accurate.

Temperature.					Wind.		Rain.	Remarks.																
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	53	45	57	44	W	Brisk	.16	<p>The weather was generally stormy and wet; and although there were no very severe frosts, yet a low temperature prevailed, so that the average was nearly 4° below that of the month. The barometer did not fall so extremely low as it did in several instances in the preceding month; but the average height was considerably below that of any month since April 1829. In that month the amount of rain was 2 inches 8-10ths above the usual quantity; but in the present it was only $\frac{3}{4}$ of an inch above the average. The 4th was stormy and boisterous; as was also the 18th, with drifting snow and keen east wind.</p> <p>Mean Pressure from the 3 daily observations 29.578 inches. — Temperature Ditto 36°.29 — Dew Point Ditto 35°.39 — Degree of Dryness Ditto 0°.90 — Degree of Moisture .. APRIL.

Temperature.					Wind.		Rain.		Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	59	50	62	47	SW	Brisk	.18		<p>The mean temperature was a little above the average; but frosts at night were of frequent occurrence. On the night of the 11th the thermometer indicated 10° below freezing. Plums and cherries were then in full flower, as were likewise some of the early flowering varieties of Pears. The leaves however were so far advanced as to afford the blossoms a little protection, and enough was saved for a crop. The day was clear, and the air very dry, as is usually the case before late frosts. Between the 22nd and 24th the nights were also frosty, but not so severe as to do any material injury to vegetation. There was a heavy shower of hail on the afternoon of the 5th.</p> <p>Mean Pressure from the 3 daily observations 29.801 inches. — Temperature Ditto 49° 42 — Dew Point Ditto 45° 78 — Degree of Dryness ... Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	70	42	80	36	E	Brisk		<p>This month was excessively wet, almost sunless, with a temperature more than 3 degrees below the average. There were only 5 days on which rain did not fall. The quantity which fell on the 5th, fully 1¼ inch, was greater than had fallen at the garden in any one day since the register was kept; and the total amount exceeded that in any month since July 1834. The barometer averaged very low. Lightning, and very heavy showers of rain, occurred on the evening of the 23rd. The night of the 25th was very clear, and a greater number of shooting stars were observed than is usual at this period of the season.</p> <p>Mean Pressure from the 3 daily observations 29.750 inches — Temperature Ditto... 54°.24 — Dew Point Ditto... 51°.90 — Degree of Dryness..... JULY.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	69	52	81	49	E	Little		<p>The weather in this month was much more favourable for vegetation than it was in the two preceding months. The mean temperature was about a degree below the average; but there was a abundance of sunshine, and a moderate quantity of rain. The 5th was very sultry, with a remarkably deep blue sky, and a few dusky white clouds. Rain followed this appearance, as is usually the case. Heavy rain fell on the 18th. The 23rd was squally, with cold showers.</p> <p>Mean Pressure from the 3 daily observations 29.928 inches. — Temperature Ditto..... 62°.69 — Dew Point Ditto..... 59°.21 — Degree of Dryness Ditto..... 3°.48 — Degree of Moisture.... Days.	Temperature.				Wind.		Rain.	Remarks.																
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	72	46	81	43	SW	Little		<p>This month was very favourable for the growth of vegetation. The mean temperature was a degree above the average. The amount of rain was upwards of an inch above the usual quantity. It fell for the most part in large quantities at a time. The 3d was boisterous and showery, with some hail in the forenoon; thunder, and heavy rain commenced at 2 P. M. and continued till upwards of an inch had fallen. Nearly as much fell on the 23d, with wind sometimes boisterous. The 4th was squally with heavy showers, and thunder in the afternoon. There was much vivid lightning on the night of the 9th. There was also thunder on the 15th, 16th, and much lightning on the night of the 25th.</p> <p>Mean Pressure from the 3 daily observations 29.931 inches.</p> <p>— Temperature.....Ditto..... 64°.36 — Dew Point.....Ditto..... 60°.60 — Degree of Dryness....Ditto..... 3°.76 — Degree of Moisture...Ditto..... .877 — Force of Vapour.....Ditto..... .524 inch. Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	85	57	104	54	S	Little		<p>The weather throughout was exceedingly fine. The mean temperature exceeded that of any corresponding month since 1825, and was about 5° above the average. The barometer was high; and the amount of rain only ¼ of the usual quantity for the month. On the 1st the thermometer in the shade was 85°, and on nine other days it rose to 80°, or higher. In the last week the temperature however began to decline rapidly, its mean being no less than 14° below that of the third week.</p> <p>Mean Pressure from the 3 daily observations 30.120 inches. — Temperature Ditto 61°.72 — Dew Point Ditto 58°.42 — Degree of Dryness Ditto 3°.30 — Degree of Moisture .. 	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	72	55	85	51	W	Little	.11		<p>This was a wet and rather cold month. The mean temperature was nearly 2° below the average, and the amount of rain upwards of 4 inches, or nearly double the usual quantity. The barometer averaged very low. Frosty nights commenced as early as the 12th; those of the 18th and 19th were unusually severe for the period of the season. On the latter night the thermometer was 10° below freezing, whilst the radiating thermometer indicated 16°. The difference between the average temperatures of this and the preceding month is usually 4°; but in the present instance the difference is nearly 14°.</p> <p>Mean Pressure from the 3 daily observations 29.706 inches — Temperature Ditto 49°.09 — Dew Point Ditto 47°.51 — Degree of Dryness ... Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.																	
1	48	27	49	22	N	Little			<p>The prevalence of South and South-west winds had the effect of maintaining the mean temperature 4° above the average. Very little rain fell, but the air was almost constantly in a state of saturation. The barometer stood remarkably high throughout, being always above 30 inches excepting on the 2nd and last days of the month. It has not averaged so high since December 1834. The general character of the month was calm, hazy, very damp and foggy.</p> <p>Mean Pressure from the 3 daily observations 30.315 inches. — Temperature Ditto 44°.32 — Dew Point Ditto 44°.07 — Degree of Dryness Ditto 0°.24 — Degree of Moisture Ditto972 — Force of Vapour Ditto290 inch. XI. *A Calendar, for four months, of the Weather, Natural History and Country Operations, at Foo-chow-foo. — By G. TRADESCANT LAY, Esq., Her Majesty's Acting Consul at that place.*

(Communicated by the RT. HON. THE EARL OF ABERDEEN.)

FOR the following document the Society is indebted to Her Majesty's Secretary of State for Foreign affairs, to whom it was transmitted by His Excellency J. S. Davis, Governor of Hong Kong.

In the present state of our communications with China all facts relating to the climate and natural productions of that empire are of great interest; and most especially to the Horticultural Society, now that Mr. Fortune has been stationed in China for the purpose of collecting seeds and plants.

It is only necessary to add that the Calendars are printed exactly as they were received, with the exception of a few verbal errors of no importance.

Thermometer.	Barometer.	Hygrometric state.	Wind.	Sky, clouds, mists.	RAIN AND ELECTRIC PHENOMENA.
<p>In the shade, Max. 100° Min. 80°</p> <p>The mercurial column attains its greatest altitude, 2-3 P. M., its minimum about four o'clock A. M., when it is stationary till sunrise, the ascent and descent gradual.</p> <p>The maximum occurred in the middle of the month; towards the end it was about 96°.</p> <p>Sensible temperature very sultry, owing to heat radiated from black roofs composed of uneven tiles. Uneven surfaces radiate more fiercely than even ones, as experiment shews.</p>	<p>1st. 29.55, ascending gradually till</p> <p>9th. 29.76 descending till</p> <p>12th. 29.73, stationary till</p> <p>18th. 29.65, stationary till</p> <p>23th. 29.49.</p> <p>Stationary.</p>	<p>Excessively dry. This dryness is not affected by a shower.</p> <p>Towels soddened in water are dried stiff in an hour or two.</p>	<p>South East.</p> <p>Often calm till near mid day, when a brisk and refreshing breeze springs up, rendered fitful at our residence by the heat of buildings, which seems to stop its course.</p> <p>It is a common remark here that along the river Min, from the sea to Foo chow, the wind comes up and goes down with the tide. The channel inclines to east and west.</p> <p>The water of the sea is colder than the water that descends from the heated country.</p>	<p>Sky in fine weather occasionally invested with a haze of a somewhat sombre hue, or sprinkled over with a few fleecy clouds or "teih ne" of the Chinese.</p> <p>22nd. Haze moderated the sensible temperature and made it feel cool, though the thermom. stood at 96°.</p>	<p>17th. In the evening a thunder shower travelled from west to east over Foo-chow, that is from one high point of the hills to another. Rained hard for a short time.</p> <p>20th. After mid-day the thunder was heard pealing in the distance, the lightning glared, the wind rose, and the rain began to descend, but not in copious effusion. One of the loudest and smartest claps, within my recollection, took place, apparently just over our head; it resembled a large piece of ordnance. A cool breeze followed, and the evening was pleasant.</p> <p>21st. In the evening, towards the NW., the clouds, broad and massy, seemed like a battery emitting sparks and flashes, which from time to time exploded in serpentine lines and coruscations, while a continuous blaze was spread over the face of the vapour, forming a splendid aurelia, in which these phenomena continued to play for more than half an hour.</p> <p>24th. A shower and thunder at day-fall.</p> <p>27th. At 2 P. M. clouds rising from the west promise a shower. A squall follows, but of short duration, as the clouds shift rapidly.</p> <p>28th. About 3 P. M. sky overcast, thunder rumbling in the distance.</p> <p>29th. Sky clouded; a few drops of rain patter upon the tiles.</p>

for July, 1844.

OBSERVATIONS ON HUSBANDRY.	FRUITS, FLOWERS AND VEGETABLES IN SEASON.	ANIMAL KINGDOM.	EVENTS AND GENERAL REMARKS.
<p>In the early part of the month the un-reaped crops of rice are shorn down. The sickle is short, of small curvature and compared with that of the English, very ineffectual. It is wielded by females as well as males.</p> <p>The setting out of the second crop of rice continues till nearly the close of the month. The blades and precocious ears are cut off and thrown down by the roots.</p> <p>27th. Saw a peasant turning in the stubble with the "Louk touk," or "kah loo," a roller armed with rows of wooden teeth or pins, like the barrel of a hand-organ. Men employed in sowing "Yay Moy," or oily grain among Tobacco and other spots, in a trench opened by a hoe or mattock.</p>  <p>Boatmen hard by employed in storing and loading salt for the interior. Air that accompanies working of the scull.</p> 	<p>The assortment of fruit small. The plums of a rich purple and of a most grateful taste, are now in season, and cover the stalls and benches in profusion. Pines are brought hither chiefly it is said from Formosa. Pomgranates serve now to deck the table, but are of small size and little flavour.</p> <p>The Jasminum Grandiflorum, or "Mole wah," is now in its prime, cultivated in ridges for a garniture of tables.</p> <p>The Vegetable most abundant now is the Convolvulus reptans, or "Oungtsy" of the natives. It is grown not in water as at Canton, but on beds, where it yields many a snow-white blossom. It is very wholesome and relished by all. The large "Tung-kwa," or vegetable marrow is abundant and very large, sometimes a foot and a half in length and about a third in diameter. The Luffa acutangula is now in prime. These are grown over Leeks on a kind of roofing. Leeks shaded by the Gourds are plentiful, being cut three or four times a year.</p>	<p>The voice of the "Hwang pong chow," or Red-winged pie is heard among the fir-trees, and is so peculiar that it is difficult to find a similitude. It is something compounded of a sob, a howl and the dying beats of a bell. When displeased it utters a peculiar clucking mixed with the scolding of a cat.</p> <p>A large forked-tailed fly-catcher, with his mate, perches on the topmost shoots of a tall tree, and from time to time soars aloft in quest of insects and then with a sweep returns back to his mate.</p> <p>A Hawk which seems to be identical with the Kestrel, utters a note which resembles that of the wry-neck, while it darts from the tall-trees to tease the fishing hawk, whose cry may always be heard, but mostly in the morning.</p> <p>Dragon-flies of red, green and blue tints, skim over pools of water, or flutter along the fences. A member of the Day-fly, or Hemerobius family, with long antennæ, is seen among dragon-flies, which it much resembles in external appearance. It is new to me.</p> <p>The field spider (Tagenaira) spreads its net, an inverted cone, among the long grass everywhere.</p>	<p>1st. Arrive at Foo chow, take up our quarters at the office of a salt monopolist on left bank of river.</p> <p>3. Meet the Superintendent of Trade.</p> <p>8. Remove to salt monopolist's residence on left bank above the bridge.</p> <p>13. Met the Governor General.</p> <p>Saw fishing Cormorants on rafts for first time.</p>

Day of month.	Therm.	Barom.	Hygrometric state.	Wind.	SKY, CLOUDS, MISTS, RAIN AND ELECTRIC PHENOMENA.
1	max. 91°	29.49	Very dry	S. East	Cumuli or fleecy clouds, with mists, which are clouds couching over the city.
2	.. 91	— .43		..	
3	.. 93	— .43		..	
4	.. 93	— .56		..	Rain fell in the night.
5	.. 93	— .66	Less dry	..	Nimbose clouds.
6	.. 85	— .60	Showery in the afternoon.
7	.. 92	— .60	Very dry	..	Cloudy.
8	.. 92	— .60		..	Morning bright.
9	.. 92	— .68		..	In the morning, rainbow over the city; day showery.
10*	.. 89 * Min. observed this night, 83°.	— .56		Morning, S. East. Evening, N. East.	Morning bright; afternoon cloudy. In an evening walk noticed large massive clouds, brooding over the valley, on this side the southern range of hills. On a sudden the wind, then southerly, veered to the north, and huge volumes of sable coloured vapour made their appearance over the city. A stagnation ensued, which lasted a few minutes, as if the atmospheric columns were vibrating between a double and opposite course; a shower followed, but did not last long. In the night the rain fell in torrents and the wind blew tempestuously. The air was chill, but had not a portable thermometer to ascertain the temperature, which I regret.
11	6 A. M. 82 10 .. 82 2½ P. M. 80 4 .. 80	— .36 — .38 — .38 — .43	No apparent change in dryness.	North	Sky, at sunrise, hazy and nimbose, black clouds skirting the hills behind the city. Wind strong and gusty. At 8 o'clock, A. M., rain had ceased. 10 A. M., rain, with a mist over the city. P. M., rain, with blinks and gleams of sunshine. Air cold to sense; wind hushed. Thunder and lightning in the night; chilly.
		Fall in Barom. followed the gale.			
12	7 A. M. 80 3½ P. M. 89	— .61 — .67			Haze; detached fragments and sheets of cloud invest the sky. The largest and most sombre masses overhang the city, the focus and centre, around which atmospheric charges seem to play.
13	Sunrise 82 P. M. 90	— .67			Morning, gray dew on the grass. Calm and massy clouds in the evening. Much foam floating down the river.
14	Sunrise 82½	— .74			
15	Not at home.				
16	Morn. 94	— .69	Very dry		Clouds threaten rain, being of a nimbose character.
17	94	— .73			Sultry in the morning, succeeded by a haze; clear at noon.
18	92	— .69			
19	92	— .66			Day fine and sultry.
20	94	— .62			P. M., a shower. Clouds red at sunset; evening fine.
21	A. M. 89 3 P. M. 85	— .56 — .51	Draught of the air scalds the face.		Morning gray and sultry. At noon a shower, during which the barometer and thermometer both fell, which is unusual, as showers are so local, that they affect not these columns, in general, at this place. Evening showery.
22	A. M. 89	— .45		N. East	Day ushered in by a drizzling shower; afterwards intermitting between sunshine and a nimbose haze. Evening showery.
23	A. M. 82 Stationary	— .41 fell $\frac{3}{100}$		S., gusty	Much rain had fallen in the night. Day throughout rainy.
24	A. M. 81	— .65		Calm At sunset N. East.	Had rained steadily in a calm night. The nimbose sheet parting a little in the south, sun broke through between seven and eight. Afternoon fine; heavy shower at sunset, and shift of wind.
25	Sunrise 82 P. M. 88	— .72		S. East	Fine, breeze refreshing.
26	Sunrise 82 Noon 90	— .72		S. East	Morning fine; breeze fresh; shower in the evening.
27	Noon 87	Stationary		S. East	Morning showery. Rainbows, primary and secondary, bestriding the city. A supernumerary arch of green.
28	P. M. 89				Morning hazy; day hot and clear.
29	Not at home.				
30	P. M. 90				
31	P. M. 90				

for August, 1844.

OBSERVATIONS OF HUSBANDRY AND GARDENING.	FRUITS AND FLOWERS IN SEASON.	ANIMAL KINGDOM.	EVENTS AND GENERAL REMARKS.
<p>Peasants employed about the Rice crop; the women on hoeing, the men in replanting where it has failed, thinning where the tufts are too dense, in stirring the soil around the root, and wrapping it up in decayed straw: the last is very laborious, as the workman kneels the while in the mud and water.</p> <p>The water-wheel, for irrigation, complains of an ungreased axle, in sounds that fill every corner of the valley.</p> <p>Tobacco cut, and dried by interlacing the leaves in hurdles to keep them flat. The stump of the plant is left to throw out a few shoots.</p> <p>The oily grain in flower. It needs the hoe but little, as few weeds venture to spring up near it.</p> <p>The Sugar-cane in full luxuriance.</p> <p>The gourds and melons mentioned in the foregoing month, continue with the <i>Momordica charantia</i>.</p>	<p>Longans, much esteemed and plentiful, now begin to shew themselves at table.</p> <p>Plums continue, but disappear towards the close of the month.</p> <p>A small green fruit, which the natives call Yew kang, is seen on stalls, (from Amoy).</p> <p>The Indian Shot, very common here, is now in flower, as is also a species of <i>Mirabilis</i>.</p> <p>Pears may be seen upon the trees in here and there an enclosure, but they are small, hard and tasteless.</p> <p>A large kind serves to adorn the greengrocer's board, which, it is said, are from the South, but they are scarcely to be eaten by a foreigner.</p> <p>Towards the end of the month Guavas are gathered green and ripen on the benches.</p>	<p>A black silky Ant, with its thorax armed with spines, and the free midriff joint, with three prongs, like a Chinese halberd, is seen coursing over the shrubs and bushes in search of glandular juices or the cutaneous excretion of the <i>Coccus</i>. Its nest, made of paper, compounded of mashed fibre, saliva and leaves and sticks, hangs on trees and fences.</p> <p>The white Crane, very common, with several of a veined plumage. The former amuses itself by catching the flies, which settle upon Cows while at pasture.</p>	<p>During the storm, a house, ignited by the falling down of a lantern, spread the flames till thirty shared the same fate. The buildings being of wood, no small effort on the part of the military, who comprise a Fire Brigade, to extinguish the flames, was required.</p> <p>Fires are infrequent; a remarkable fact, as the houses are chiefly timber, the air dry, and the people crowded.</p> <p>Visited the highest hill within the basin-like valley of Foo-chow, and observed that the rock is porphyritic, chiefly of felspar, which, disintegrating, crumbles into a fine red clay.</p> <p>The "Gazelle," sent by Capt. Gribble, to enquire for our welfare arrives. She had experienced very heavy weather, and witnessed great fluctuations in the barometer during the gale.</p> <p>"Gazelle" starts. The Chinese spinsters pray "New Lang" to bestow on them ingenuity, and in order to know whether the divinity listens to their vows, each strives to thread a needle behind her head. If she chance to hit the eye of the needle, her parents and friends congratulate her; if she misses, they think the opening talents of the young maid will fall short of their wishes. In Se-chuen young ladies put a spider into a box and hold it while they recite a prayer to New Lang. If the spider has in the meantime begun to spin a web, they deem it a good omen. Music and processions at night.</p> <p>The "Petrel," belonging to Messrs. Dent and Co., anchors at the Lo Sing Pagoda.</p> <p>Mr. Braine arrives at Foo-chow, with a view of making enquiries as to the prospects of trade.</p>

Day of month.	Therm.		Barom.	Hygrometric state.	Wind.	SKY, CLOUDS, RAIN, MISTS, AND ELECTRIC PHENOMENA.
	Min.	Max.				
1	82	90	29.72	Dry	N. East	Morning and day clear
2	82	90	— .72	Morning clear, in the evening clouds rose in the North and followed each other in quick succession. Wind at that time easterly. A gentleman remarked that it was going to blow from the South again.
3	83	89	— .63	A fresh breeze has been blowing all night from the South, which accounts for the Therm. being at sunrise 2 degrees above its usual average, 82. The sky bore a nimbose aspect all day. Wind gusty in the Evening. The night cloudy, but not so as to obscure the moon.
4	86	88	— .60	..	A calm S. East	Sun breaking from between the clouds in the Morning. In the Afternoon, heavy rain with thunder and lightning.
5	84	88	— .66	..	S. East	Morn, clouds dispersing and the sun shining. In the Afternoon, a shower, evening, fine.
6	84	88	— .68	Morn, fine, at first clouded agreeably, as clouds by their interposition screen the earth.
7	80	81	— .70	..	Newly calm S. East	Day cloudy. Is the unusual coolness of this day owing to the clouds? Night cool, sky overcast with dark motionless clouds.
8	78	Not obsvd.	— .74	..	S. East	Day cloudy. This fall in the Therm. and rise in the Barom. betokens a Northerly wind. Moisture fell in the night.
9	—	89	— .78	Day throughout with sky overcast, but no rain fell.
10	Not	at	home.	..	N. East	Rainy and cold on the ridge of the hills.
11	—	78	— .78	..	N. and NE.	No rain at Foo-chow. Sky cloudy. The clouds of the cold-region wind, that is, strato-cumuli loose above, even below, menace rain without falling into a rain cloud.
12	74	—	— .78	..	N. East	Sky overcast. The foam and color of the water indicate that rain has fallen up the basin of the river Min, i. e. on the hills to the westward.
13	Not	at	home.	Rain, clouds, and piping winds at the Monastery.
14	—	80	— .78	Day, a mixture of fine and cloudy.
15	75	—	— .78	Morn overcast. Breeze fresh and cool.
16	—	85	— .76	..	S. East	Morn, sky covered with hard-seeming clouds, clear as the day sprang up.
17 to 20	—	83	— .70	..	N. East	Sky clear with occasional variations of that dark-stoned and apparently solid mantle, which is peculiar to the N. wind in northern latitudes, as it is to the S. in southern latitudes.
21	—	82	— .78	Morn, light rain accompanied a cloudy dawn, or, the cloud was so low as to couch upon the surface of the earth. Day hot and misty.
22	Not	observed.	Day very hot and misty.
23	—	89	— .79	Day, very hot and sultry.
24 to 27	—	88	— .78	Weather fine and cheerly. The North-East Monsoon fairly set in.
28	84	88	— .79	Day, fine and sultry.
29	84	88	— .79	Day, fine and sultry.
30	80	84	— .79	Day fine.

for September, 1844.

OBSERVATIONS OF HUSBANDRY AND GARDENING.	FRUITS AND FLOWERS IN SEASON.	ANIMAL KINGDOM.	EVENTS AND GENERAL REMARKS.
<p>In this month the beds of the <i>Convolvulus reptans</i>, or Oung-tsy of this place are cleared and the soil turned up for planting the "pak tsae," or Chinese Turnip.</p> <p>These are first sown and then transplanted, as are all vegetables belonging to the Cruciferous family.</p> <p>The stakes and roofings as substitutes for trellis work which supported the different kinds of gourds and melons are cleared away and the Leeks, which they shaded, begin to lose their freshness and beauty.</p> <p>The fields of rice that formed such an object of solicitude in the preceding months, are now comparatively quiet, rejoicing in one continuity of the richest green.</p> <p>Still the farmers are not asleep, men and women are seen in the fields searching for weeds that may spring up unawares.</p> <p>The hoeing of sweet potatoes and the training of their stems form a part of the husbandman's business now.</p> <p>To water the roots and stir the earth has an obvious tendency to nurse the tubers, while the care bestowed on the tops is with a reference to their usefulness in affording provender for pigs.</p> <p>The <i>Eleocharis tuberosa</i> blossoms in this month. Its jointed rushlike stem makes it appear unique amongst plantations of rice.</p> <p>White awned and red awned rice in flower, these are planted later than the first crop of rice, and are later in coming to the sickle. They are called "sook" by the natives; the latter crop just beginning to open. This is called "wang ching me;" or, otherwise, "tew," the Fochow pronunciation of the Mandarin "taou."</p> <p>Job's tears, grown here for the sake of the involucre, or enamelled sheath of the flower, fringe some of the rice plots very charmingly, as it is at once in fruit and flower. The leaves are softly turned and luxuriant; the clusters or panicles nodding their graceful forms. These beads of nature's own turning are in request for rosaries.</p>	<p>The Longans are gathered in this month and are met with in profusion every where.</p> <p>The zeal and joy that accompanied the plucking of this fruit remind one of greater things; the Autumn at home; and, the Grape gatherings in the East. A fortnight, or three weeks before they are plucked, lodges are built to guard them from thieves, props are placed under their boughs and their trunks surrounded with a ruff of thorns.</p> <p>The Guavas are gathered generally before they are ripe, for the sake of economy. When taken from the tree with a nice attention to their color and form, they prove very acceptable, but if bought from the stall they are little esteemed.</p> <p>Various kinds of Toad-stools are gathered among the Fir-trees by the peasantry, their color is yellow, with a mixture of red.</p> <p>They are dried before they are fit to eat.</p> <p>Leeks are very abundant. The pik-tsae is fit for the table, as is also the sweet potatoe.</p> <p>The po-tsy, or Spinach appears.</p> <p>The Brinjal is grown here, but is not remarkable for size or goodness.</p>	<p>Magpies moult in the early part of this month and are consequently seen moping in silence, or uttering a plaint or two as if heart-sick. In about a fortnight they overcome their indisposition, gain a new suit of feathers and hold their noisy levees on the sides of the hills with great spirit and fire.</p> <p>The calls of the Shrike or Butcher bird are heard occasionally.</p> <p>Soon after Sunrise he indulges the feathered tribes with a song, but he is so shy of letting his powers be known that I am not aware any Naturalist, except the writer, ever noticed it.</p> <p>The white Herons assemble and wheel round as if mustering their numbers for an aery jaunt, though it is not apparent that all leave for Southern regions. The fishing hawks assemble at day-fall and wheel round in a kind of social pastime, or a trial of their powers, as they soar to a great elevation. Swallows begin to meditate a migratory journey.</p> <p>In this month, the Cicadae, seated upon the Fir-trees make the groves and copses resound. As the old ones die, younger ones emerging from their humble condition in holes of the ground, leave their last garments behind and after a few hours climb to the tops of the trees.</p> <p>Song of the Throstle, "Osheput" of Canton, and "Ching chow" of this place is heard at day-spring. The notes are mellow and heart-cheering. They may be set down in diatonic scale thus.</p> <p>Song of the Chinese Throstle.</p> 	<p>I am told that there is a current of old Spanish Dollars running from Chin-chew or Cheun-chow at the rate of 1½ lac per month; some hoards must have been ransacked to supply this stream. Mr. Braine starts for the Pagoda, to join the "Petrel."</p> <p>The fleet of Junks, from Ningpo and other places on the Coast, begins to diminish, as the Shipmen are wishful to save some of the Monsoon.</p> <p>Started a fine hare amongst the fir-trees.</p> <p>Visit the Monastery of Koo-shan seated in a romantic spot.</p> <p>(20) Public examination in the Four Books takes place to day. The Candidates assemble to write essays at night. Other classics on each alternate day till the 29th.</p> <p>Emperor's birth-day; but little stir about it in vicinity. "Proserpine" Steamer arrives.</p> <p>"Proserpine" leaves to take her station at the mouth of the Min, to await the arrival of the "Castor" with His Excellency the Chief Superintendent.</p>

Day of month.	Therm.		Barom.	Hygrometric state.	Wind.	SKY, CLOUDS, MISTS, RAIN AND ELECTRIC PHENOMENA.
	Min.	Max.				
1	—	77	29.35	Dry	N. East	Cloudy with light showers.
2 and 3	} Not at		home.	Weather fine; wind strong, which at times brought clouds from the North.
4	—	84	— .85	Day fine.
5 and 6	} Not at		home.	Weather bright and fair at the entrance of the River, where the Proserpine is lying.
7	—	86	— .60	Sky overcast during the day.
8	Not	at	home.	
9	—	80	— .93	Very dry	..	City enveloped in mist all day.
10	Not	taken		
11	Not	taken.		Sky overcast at various times during the day.
12	Not	taken.		Dry	..	
13	—	81	— .87	Day cloudy.
14	—	81	— .87	Ditto.
15	—	81	— .83	Ditto.
16	—	80	— .83	Very dry	..	The sky clearer to-day. The surrounding hills seem to cause that prevalence of haze so common here in this month.
17	—	80	— .81	Sky during the day, alternating between fine and cloudy.
18	—	84	— .79	Day fine.
19	—	82	— .83	..	Noon, NE. and E.	Dark clouds with their edges colored red, usher in the sunrise. Sky clear and cool throughout the day. Strong southerly breezes at noon.
20	—	78	— .83	..	N. East	
21	(Sun rise), 71	76	— .83	4. AM. Showery. The weather feels cold to sense. Cloudy.
22	—	82	— .82	Dew on the grass. Day fine, clear, and warm.
23	—	82	— .84	Dew on the grass at sunrise. Midday fine. PM. Sky overcast with a cloud that reached to the ground. Night clear and cold. Wind rising: the couching vapour merely the forerunner of a colder North breeze.
24	64	72	— .87	Day cloudy; evening sombre, followed by a cloudy night.
25	—	72	— .87	Less dry	..	Day fine; cloudy at night; about midnight, rain.
26	70	71	— .87	Air less chilly in the morning: night very mild, fine.
27	—	82	— .84	Day fine; mist over the City. Evening, clouds threatened rain, but it was only the precursor of heat.
28	—	83	— .82	A fog in the morning. Fine and sultry, mid-day. Showery at day-fall.
29	72	72	— .96	Day cold and overcast. Mist heavy and cheerless over the City.
30	72	80		..	S. East	A sense of warmth in the atmosphere and the previous night was mild. Noon and afternoon clear and cheerly.

XII. *Notes made in the Garden of the Horticultural Society upon the rate of growth by plants at different periods of the day.*
 Second Series. — *By JOHN LINDLEY, Ph. D., F. R. S.*

IN a previous part of this Volume has been given a detailed account of certain observations upon the growth of plants, and of the inferences which appeared to be deducible from them. Those observations were however made upon plants placed in the atmosphere of a stove, and therefore it appeared desirable to institute a similar enquiry into the rate of growth in the open air, under the ordinary conditions to which vegetation is exposed in this climate.

For this purpose one specimen of each of the following species, viz., the Hop, Vine, Sweet Willow, Scarlet Running Kidney Bean, Fig, Jerusalem Artichoke, and Gourd, was planted in front of a vinery in a sheltered situation favourable for their quiet growth, and their increase in length was noted three times daily. The periods for the observations were fixed at 4 o'clock in the morning so as to ascertain the growth during darkness, at noon so as to obtain the growth in the cooler part of the day, and at 8 P. M., up to which period the plants would have been exposed to the influence of the hottest and driest part of the 24 hours.

The duty of watching the experiments was intrusted to Mr. Joseph Holmes who examined the plants most carefully for two months, during which time 1011 observations were collected. It has not however appeared necessary to print at length the August observations, because they convey no information beyond what is furnished by the July experiments, as detailed in the following tables.

Observations on the growth of the Hop, taken at 4 A. M. (Night), 12 Noon (Morning), and 8 P. M. (Afternoon), during July, 1844.

1844.	NIGHT.			MORNING.			AFTERNOON.		
	Growth.	Mean Temp. from 8 P. M. to 4 A. M.	Remarks on the Weather at 4 A. M.	Growth.	Mean Temp. from 4 A. M. to 12 Noon.	Remarks on the Weather at 12 Noon.	Growth.	Mean Temp. from 12 Noon to 8 P. M.	Remarks on the Weather at 8 P. M.

. Broken in taking the measure, the shoot having become much curved at the extremity.

Table shewing the amount of growth of all the foregoing plants during the months of both July and August.

		NIGHT.	MORNING.	AFTERNOON.
Hop	July	42.02 (1.44 av.)	40.12 (1.38 av.)	+ 60.41 (2.01 av.)
Vine	July	+ 2.34 (.08 av.)	2.04 (.07 av.)	2.16 (.07 av.)
	August	.86	+ 1.94	1.64
Sweet Willow	July	3.77 (.13 av.)	4.81 (.16 av.)	+ 5.13 (.17 av.)
	August	2.16	3.79	+ 4.44
Scarlet Runner	July	23.11 (.79 av.)	+ 50.21 (1.73 av.)	47.15 (1.57 av.)
	August	8.86	9.93	+ 11.32
Fig	July	1.63 (.05 av.)	+ 3.16 (.10 av.)	2.12 (.07 av.)
	August	.71	+ 1.50	1.07
Jerusalem Artichoke	July	8.23 (.28 av.)	+ 12.27 (.42 av.)	9.98 (.33 av.)
	August	4.15	+ 7.09	6.95
Spanish Gourd	July	21.23 (1.01 av.)	19.52 (.97 av.)	+ 28.53 (1.35 av.)
Total		119.07	156.26	180.90

The examination of these tables shews that the same discrepancies as were remarked on the former occasion, when the plants under observation were growing in a hothouse, occur when the plants are exposed to the open air; and prove conclusively that those discrepancies were not owing to the artificial state in which the experimental specimens were placed.

The period of the day at which the greatest growth takes place still proves to be the afternoon, if all the experiments are regarded as but one; for the numbers stand thus: night 119.07, morning 156.26, afternoon 180.90; but when the experiments are separated it then appears that the period of maximum growth varies with the species; in the Hop, Sweet Willow and the Gourd it was the afternoon; in the Fig and Jerusalem Artichoke it was the morning; in the Vine it was the night in July and the morning in August; in the Scarlet Runner the morning in July and the afternoon in August. It is especially worthy of observation that this does not correspond with the observations of 1843, for at that time the Willow, which in 1844 grew upon the whole fastest in the after-

noon, that is to say in the hottest and brightest part of the 24 hours, increased most in the morning which was the coolest and most overcast. So again the Fig grew fastest in 1844 when exposed to the cool of the morning, and uninterrupted light; but in 1843 its maximum growth took place, between 6 in the afternoon and 12 at night, at which time it could have received little or no sunshine.

If we attempt to reconcile these conflicting results we shall find the separate as perplexing as the general observations. For instance, the greatest morning growth of the Jerusalem Artichoke and the Vine took place on the 26th; but at the same time the Hop, Sweet Willow and Fig were growing slowly, and even the Scarlet Runner, which resembled the Vine and Artichoke most nearly, had not reached its maximum. The greatest afternoon growth of the Jerusalem Artichoke and the Hop was on the 7th, but at that time the Vine, which had previously corresponded with the former, scarcely exceeded its average rate; the growth of the Scarlet Runner was considerable; the Fig however was below its average, and the Gourd had reached its minimum. So again on the 3rd, when the Hop grew slower than at any other period during the month, the Fig made its maximum growth; on the 27th while the Vine and Scarlet Runner grew fastest, the Fig grew slowest, and the same thing happened between these plants on the 27th. Similar instances will be found on an attentive scrutiny of the tables.

If however, there are so many instances of discrepancy, there are also some of correspondence. Thus, the Jerusalem Artichoke and the Vine not only made their maximum morning growth on the 26th, but their minimum night growth on the 21st; in like manner the Fig and the Sweet Willow which made their maximum night growth on the 24th, also made their minimum morning growth at the same time: an unexpected result amidst so much conflicting matter, when the totally different nature of the plants is taken into account. These however seem to be

mere coincidences, for there is little accordance between the plants at other times; for example, if we compare the Vine and Jerusalem Artichoke as to their rate of growth at other periods near to those when they are alike, we again find nothing but dissimilitude. Thus,

	Vine.			Jerusalem Artichoke.		
	Night. (.08 av.)	Morning. (.07 av.)	Afternoon. (.07 av.)	Night. (.28 av.)	Morning. (.42 av.)	Afternoon. (.33 av.)
July 20	.09	.04	.03	.10	.21	.07
21	— .02	.03	.04	— .05	.15	.36
22	.04	.09	.07	.11	.40	.19
25	.13	.11	.16	.16	.49	.44
26	.16	+ .18	.10	.55	+ 1.06	.34
27	.11	.07	.20	.29	.78	.33

Here we see that although the Vine and Sweet Willow agreed on two occasions very near about the same time, they otherwise differed in the most singular manner. In the night of July 20th, the Vine was just above its average, but the Jerusalem Artichoke was not half way up to its average; and so on in the other cases.

If we next proceed to examine what the circumstances were which favoured or retarded the growth of the experimental plants, it will be found that there is scarcely more possibility of determining that point than of reconciling their differences with each other.

Plants are always said to grow fastest during a thunder storm, the peculiar electrical state of the atmosphere at that time being regarded peculiarly favourable to growth. Heat also is looked upon as a powerful cause of rapid developement, especially if in combination with moisture; on the other hand, cold is thought to produce the contrary effect. Finally a brisk wind, as well as bright light, is believed to impede vegetation, while warm overcast weather is favourable to growth. But the actual results hardly confirm those opinions.

On July 19th, there was a thunder storm in the morning, the thermometer being $65\frac{1}{2}^{\circ}$. The growth of the experimental plants on that occasion was as follows :

Hop	1.22 or .16 below the average.
Vine	.04 or .03 below the average.
Willow	.22 or .06 <i>above</i> the average.
Scarlet Runner	2.54 or .81 <i>above</i> the average.
Fig	.02 or .08 below the average.
Jerusalem Artichoke	.19 or .23 below the average.
Gourd	.76 or .31 below the average.

So that on this occasion, when the atmosphere was highly charged with electricity, five out of the seven experimental plants grew considerably below the average rate, and of the others one but little exceeded it. It might perhaps be supposed that the influence of the thunder storm would be felt shortly before and after its occurrence, rather than during its continuance; but that was not the fact.

On the occasion in question the growths immediately before and after the thunder storm were as follows :

	Before.	After.
Hop	.80 or .64 below the average	1.14 or .87 below the average
Vine	.04 or .06 below do.	.02 or .05 below do.
Willow	.10 or .03 below do.	.11 or .06 below do.
Scarlet Runner	.68 or .11 below do.	.85 or .72 below do.
Fig	.00 or .05 below do.	.03 or .04 below do.
Jerusalem Artichoke	.07 or .21 below do.	.14 or .19 below do.
Gourd	1.30 or .29 <i>above</i> do.	1.06 or .29 below do.

So that in every instance except one the average rate of growth was diminished, instead of being increased, and the night growth of the Fig was arrested altogether, an event which only happened on six other occasions, and then under circumstances equally unintelligible; on one of those occasions the thermometer was $58\frac{1}{2}^{\circ}$ with rain; on another $71\frac{1}{2}^{\circ}$ and hazy.

For the purpose of ascertaining the real effect of both high and low temperatures, the following tables have been drawn out.

Rate of growth under the *highest* Temperature.

	Night.		Morning.		Afternoon.	
	Temp.	Growth relative to average.	Temp.	Growth relative to average.	Temp.	Growth relative to average.
Hop	65½	2.14 or .70 above	71½	1.51 or .12 above	76½	2.52 or .51 above
	66½	3.63 or 2.49 above	69	1.68 or .30 above	75½	2.70 or .69 above
Vine	65½	.08 or average	71½	.07 or average	76½	.16 or .09 above
	66½	.16 or .8 above	69	.11 or .04 above	75½	.10 or .03 above
Sweet Willow	65½	.23 or .10 above	71½	.10 or .04 below	76½	.10 or .07 below
	66½	.09 or .04 below	69	.13 or .03 below	75½	.26 or .09 above
Scarlet Runner	65½	.75 or .04 below	71½	2.75 or 1.02 above	76½	1.77 or .20 above
	66½	.75 or .04 below	69	3.40 or 1.67 above	75½	1.42 or .15 above
Fig	65½	.16 or .11 above	71½	.00 or .10 below	76½	.05 or .02 below
	66½	.04 or .01 below	69	.10 or average	75½	.04 or .03 below
Jerusalem Artichoke	65½	.14 or .14 below	71½	.36 or .06 below	76½	.44 or .11 above
	66½	.55 or .27 above	69	.49 or .07 above	75½	.13 or .20 below
Gourd	63	1.91 or .90 above	65½	.76 or .21 below	72	1.82 or .53 below
	62½	.50 or .61 below	66	.89 or .08 below	67½	2.83 or 1.48 above 2.20 or .85 above 1.52 or .17 above

Here we have no intelligible result, but the testimony is just as conflicting as in other cases. It is true that both the Hop and Vine were constantly above their average when exposed to the highest temperature, and at all periods of the day; that both these plants and the Sweet Willow and Fig, acquired their maximum night growth under those circumstances; that the Gourd also gained its greatest afternoon increase on one occasion of the highest temperature. But, on the other hand, while on one occasion a night temperature of 65½° gave the Willow its maximum growth, another night temperature of 66½° resulted in .04 below the average; indeed the Willow was below the average in 4 out of 6 instances of highest temperature. Then we find the Scarlet Runner always below the average at night at the very moment when others were acquiring their maximum; and in the case of the Gourd, which was exposed to an afternoon temperature of 67½° for three successive days, although on the first day it acquired its maximum, yet on the 2nd day afterwards it had fallen so low as .17 above the average, the circumstances remaining to all appearance the same.

Rate of growth under the *lowest* Temperature.

	Night.		Morning.		Afternoon.	
	Temp.	Growth relative to average.	Temp.	Growth relative to average.	Temp.	Growth relative to average
Hop . . .	52	.80 or .64 below	56	.83 or .55 below	60	1.14 or .37 below
	52½	.63 or .81 below	58	.70 or .68 below	60½	1.55 or .46 below
Vine . . .	52	.04 or .04 below	56	.07 or average	60	.02 or .05 below
	52½	.09 or .01 <i>above</i>	58	.05 or .02 below	60½	.03 or .04 below
Sweet Willow .	52	.10 or .03 below	56	.18 or .02 <i>above</i>	60	.11 or .06 below
	52½	.09 or .04 below	58	.21 or .05 <i>above</i>	60½	.10 or .07 below
Scarlet Runner	52	.68 or .09 below	56	2.91 or 1.18 <i>above</i>	60	.85 or .72 below
	52½	.52 or .27 below	58	.71 or 1.72 below	60½	.66 or .91 below
Fig	52	.0 or .05 below	56	.04 or .06 below	60	.03 or .04 below
	52½	.0 or .05 below	58	.18 or .08 <i>above</i>	60½	.05 or .02 below
Jerusalem Artichoke	52	.07 or .21 below	56	.40 or .02 below	60	.14 or .19 below
	52½	.10 or .18 below	58	.67 or .25 <i>above</i>	60½	.24 or .09 below
Gourd . . .	52	1.30 or .29 <i>above</i>	56	.70 or .27 below	60	1.06 or .29 below
	52½	.71 or .30 below	58	1.18 or .21 <i>above</i>	61	1.46 or .11 <i>above</i>

In this instance it is evident that in general the lowest temperatures were unfavourable to growth. But it is to be observed that the Vine attained its minimum growth on only one of these occasions (in the afternoon); that the Fig indicated the minimum night growth on two occasions; and, what is most inexplicable, we have 9 cases of the growth being actually above the average in presence of the lowest temperatures: such tender plants as the Fig, the Scarlet Runner and the Gourd (on three occasions out of six) being the species in which this singular anomaly took place.

It does not seem desirable to extend these tables further: for if the observations are analysed for the effects of wind or bright light, there are the same inexplicable discrepancies. Indeed the average of the afternoon growth being so much higher than that of the morning, as was shown in the table at p. 255, seems to render an examination into the effect of light superfluous; for it must be admitted that on an average we have more light between noon and 8 P. M., the time of the afternoon observations, than in either of the other periods.

I think no physiologist could have anticipated such results as these. They are in fact so much at variance with what could have been expected, that I should have been inclined to doubt the accuracy of the observations themselves, if I did not know that they were conducted with most scrupulous exactness, and by the method already described in my former report, (see page 103.) This seems as little open to error as any plan that could be contrived, and I have no doubt of its being a true representation of the facts as they occurred.

It therefore seems more than ever certain, that the conclusion to which the former observations pointed was correct, namely, that some agent, distinct from heat, light, or moisture, is in operation, the nature of which we have at present no means of ascertaining.

ADVERTISEMENT.

THE Committee appointed by the Horticultural Society to direct the publication of the Papers read before them, take this opportunity to inform the Public, that the grounds of their choice are, and will continue to be, the importance and singularity of the subjects, or the advantageous manner of treating them, without pretending to answer for the certainty of the facts, or the propriety of the reasonings, contained in the several Papers so published ; which must still rest on the credit or judgment of their respective Authors.

It is likewise necessary, on this occasion, to remark, that it is an established rule of this Society, to which they will always adhere, never to give their opinion, as a body, upon any subject, either of Nature or Art, that comes before them. And, therefore, the thanks which are proposed from the Chair, to be given to the Authors of such Papers as are read at the General Meetings, or to the Persons who send fruits, or other vegetable productions, or exhibit Inventions of various kinds to the Society, are to be considered in no other light than as a matter of civility, in return for the respect shewn to the Society by these communications.

1	39	27	39	23	W	Little	.43	<p>The year commenced with snow and sleet; and the thermometer on the night of the 2nd was 18° below freezing. With this exception, however, there were no severe frosts throughout the month; and the temperature was 2½° above the average of nineteen preceding years, the period for which averages mentioned in these remarks have been calculated. The amount of rain exceeded the usual quantity by nearly ¼ of an inch. The morning of the 12th was foggy; heavy and continued rain fell throughout the day and night. The last day of the month was remarkable for stormy showers, forming a succession of hail, snow, sleet and rain.</p> <p>Mean Pressure from the 3 daily observations 29.968 inches. — Temperature Ditto 39° .47 — Dew Point Ditto 38° .43 — Degree of Dryness Ditto 1° .04 — Degree of Moisture Ditto944 — Force of Vapour Ditto236 inch. FEBRUARY.

Temperature.					Wind.		Rain.	Remarks.																
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.																	
1	39	20	51	16	NW	Little		<p>The temperature was upwards of 3° below the average ; and with very few exceptions the nights throughout the month were more or less frosty. The barometer averaged considerably lower than usual ; and in a corresponding degree, the amount of rain was greater. The weather throughout was very inconstant, and on the whole rather severe. A heavy fall of snow commenced, 4 A.M., on the morning of the 2nd, and fell to the depth of 4 inches in the course of the day. The barometer was exceedingly low on the 26th, on which heavy showers of rain occurred with intervals of sunshine ; the night was boisterous.</p> <p>Mean Pressure from the 3 daily observations 29.597 inches.</p> <p>— Temperature Ditto 36°.23</p> <p>— Dew Point Ditto 34°.79</p> <p>— Degree of Dryness Ditto 1°.44</p> <p>— Degree of Moisture .. Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.									
1	65	29	78	23	NE	Little			<p>This month was very dry; the days hot for the period of the season and the nights cold and often frosty. In 12 of the latter the thermometer was at, or below the freezing point; but 18 nights were indicated by the Radiating thermometer as being more or less frosty. The barometer stood high. The amount of rain was less than in any corresponding month for at least 19 preceding years, with the exception of 1842. The degree of dryness as indicated by the hygrometer was unusually great, especially on the 9th, 10th, 26th; and on the 30th, it attained almost the highest pitch of dryness ever observed in this country.</p> <p>Mean Pressure from the 3 daily observations 30.097 inches.</p> <p>— Temperature Ditto 53°.26</p> <p>— Dew Point Ditto 45°.21</p> <p>— Degree of Dryness ... Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	70	38	82	32	E	Brisk		<p>This was an excessively dry month, uncongenial to most kinds of vegetation; for, excepting three days, the wind was constantly from north-east or east, very dry, and likewise cold, as appears from the temperature being a degree below the average, notwithstanding the abundance of sunshine. The very limited quantity of rain which fell at intervals was quickly evaporated; for the hygrometer indicated not only great dryness during the day, but also a considerable degree in the mornings and evenings, periods in which the air is generally found moist. The weather was very boisterous between the 17th and 20th inclusive.</p> <p>Mean Pressure from the 3 daily observations 30.068 inches — Temperature Ditto... 54°.78 — Dew Point Ditto... 46°.62 — Degree of Dryness..... JUNE.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	72	44	88	40	NE	Brisk		<p>More rain fell in this month than in both the two preceding, yet the quantity was not equal to half the usual average. Till the 25th merely the surface of the ground was occasionally wetted; more fell on the day above mentioned than had previously fallen, in the whole amount, since the middle of April. It was found that even this quantity did not moisten lower than 6 inches in most soils; consequently the roots of trees were little benefited by it. The mean temperature was fully 2° above the average, the wind being chiefly from South-west and West, directly opposite to the cold points from which it came in the preceding month. Thunder occurred on the 18th; the 7th was very boisterous.</p> <p>Mean Pressure from the 3 daily observations 29.936 inches.</p> <p>— Temperature Ditto 62°.37</p> <p>— Dew Point Ditto 53°.69</p> <p>— Degree of Dryness ... JULY.

Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	79	54	93	53	S	Little	.34	<p>A high temperature was still maintained throughout this month. The period between the 21st and 28th was remarkably hot, the thermometer reaching between 80° and 90° in the shade, one day excepted. On the 25th it was as high as 92°. The quantity of rain was but little short of the average; yet the ground at some depth still continued dry. A very heavy thunder storm occurred on the afternoon of the 19th, accompanied with rain and hail. The air was very clear on the 20th; and then the hot period set in as above noticed. The first week was cloudy and wet; but with few exceptions the rest of the month was unusually bright, the sky being frequently quite cloudless.</p> <p>Mean Pressure from the 3 daily observations 29.883 inches. — Temperature Ditto 63°.71 — Dew Point Ditto 57°.53 — Degree of Dryness Ditto 6°.18 — Degree of Moisture Ditto781 — Force of Vapour Ditto472 inch. AUGUST.

Days.	Temperature.				Wind.		Rain.		Remarks.																
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In.	Pts.																	
1	71	45	74	42	W	Strong	.02		<p>The mean temperature declined fully $2\frac{1}{2}$ degrees below the average; but the weather on the whole was very favourable for bringing crops to maturity. The depth of rain was about half an inch below the average for this month. The barometer was low till the 15th, after which no rain fell with the exception of two slight showers; and towards the end of the month the barometer stood high. There was a heavy shower, with squall, at noon on the 7th; and on the 14th a very heavy squall commenced suddenly, and likewise at noon, with rain in torrents.</p> <p>Mean Pressure from the 3 daily observations 29.799 inches.</p> <p>— Temperature.....Ditto..... 59°.94</p> <p>— Dew Point.....Ditto..... 54°.22</p> <p>— Degree of Dryness....Ditto..... 5°.72</p> <p>— Degree of Moisture...Ditto..... .811</p> <p>— Force of Vapour.....Ditto..... .416 inch.</p> <p>Least observed degree of Moisture..... .444</p> <p>Maximum Temperature in the Shade.... 80°.</p> <p>Minimum Temperature in ditto..... 38°.</p> <p>Maximum Temperature in the Sun 92°.</p> <p>Minimum of Terrestrial Radiation 33°.</p> <p>Mean Temperature of External Air 59°.69</p> <p style="text-align: center;">WINDS.</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td>North</td> <td>1 days</td> <td>N. Days.	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	84	44	94	40	SE	Little		<p>The mean temperature, considerably depressed in the latter part of the preceding month, again rose above the average in the commencement of the present. The amount of rain was scarcely half the usual quantity. There was much sheet lightning on the evening of the 5th. On the 8th the thermometer exposed to the sun's rays was as high as 111°; and this high temperature was followed by thunder, lightning and heavy rain in the evening. On the evening of the 9th there were also lightning and heavy rain. The night of the 18th was 24° colder than that of the 16th. Frost was experienced on the nights of the 29th and 30th.</p> <p>Mean Pressure from the 3 daily observations 29.995 inches. — Temperature Ditto 57°.93 — Dew Point Ditto 54°.71 — Degree of Dryness Ditto 3°.22 — Degree of Moisture .. OCTOBER.

Days	Temperature.				Wind.		Rain.	Remarks.								
	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	70	45	92	43	SW	Little		<p>The average temperature was still maintained; and there was likewise abundance of moisture. The quantity of rain which fell between the 1st of April and the commencement of this month was 6 inches $\frac{8}{10}$; whereas the average for the same period is 12 inches $\frac{6}{10}$; and deducting $1\frac{1}{2}$ inch, the excess above the average for October, there remained about 11 inches of rain still due at the end of the month. Nearly as much fell on the 14th and 15th as there did in the months of April, May, and June of the present year. The barometer averaged very low; the greatest depression being about the middle of the month when the great fall of rain took place. Previously to this, it was found that in borders not watered the soil was dry to the depth of a trench, $2\frac{1}{2}$ feet deep.</p> <p>Mean Pressure from the 3 daily observations 29.674 inches</p> <p>— Temperature Ditto 50°.04</p> <p>— Dew Point Ditto 48°.61</p> <p>— Degree of Dryness ... NOVEMBER.

Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	50	40	51	38	E	Brisk	.38	<p>The mean temperature was a little above the average. The amount of rain was nearly half an inch above the usual quantity for the month, although none fell after the 14th with the exception of a slight deposition on the 21st. The air, except in a very few instances, was constantly saturated with moisture. Damp as the months of November usually prove, the present exceeded every one in that respect, for at least 18 previous years. Sharp frosts occurred on the nights of the 26th and 27th.</p> <p>Mean Pressure from the 3 daily observations 29.767 inches — Temperature.....Ditto..... 43°.85 — Dew Point.....Ditto..... 43°.74 — Degree of Dryness.....Ditto..... 0°.11 — Degree of Moisture.....Ditto..... .996 — Force of Vapour.....Ditto..... .287 inch. DECEMBER.

Temperature.					Wind.		Rain.	Remarks.								
Days.	Max.	Min.	Sun.	Rad.	Direction.	Force.	In. Pts.									
1	42	33	55	32	NE	Brisk		<p>This month was one of continued severity. The mean temperature was 7° below the average. So early in the month as the 5th and 6th the thermometer fell 18° below freezing. Frost continued till the 14th, when it was found to have penetrated to the depth of 8 inches in Kitchen Garden soil; but where the ground had been recently dug the frozen crust was only 6 inches thick. The wind was wholly from East, South East or North East, but chiefly from the latter. Dense fogs were of frequent occurrence. The nights of the 19th and 20th were boisterous.</p> <p>Mean Pressure from the 3 daily observations 29.85 inches — Temperature Ditto..... 33.89 — Dew Point Ditto..... 32.39 — Degree of Dryness Ditto..... 1.50 — Degree of Moisture Ditto..... 930 — Force of Vapour..... GENERAL INDEX

TO THE

FIRST AND SECOND SERIES

OF THE

TRANSACTIONS OF THE HORTICULTURAL SOCIETY OF LONDON.

. The Roman numerals indicate the respective Volumes; the First Series is to be understood, unless the references are preceded by 2 S., when the Second Series is denoted.

AARD-AKER (Earth Nut), ii. 359.
Abdel assis (Turkish name of the *Cyperus esculentus*), vi. 50.
ABEL, Dr., vi. 272, 486, 535; vii. 524, 525; 2 S., ii. 30.
Abelia triflora, 2 S. i. 456.
ABERCROMBIE, vi. 218.
ABERDEEN, Earl of, 2 S. iii. 237.
Abies amabilis, 2 S. ii. 250.
— *Deodara*, 2 S. ii. 237, 240, 242, 263.
— *Douglasii*, 2 S. ii. 242, 260.
— *grandis*, 2 S. ii. 250.
— *Menziesii*, 2 S. ii. 260.
— *Morinda*, 2 S. ii. 242, 263.
— *nobilis*, 2 S. ii. 242, 250.
— *religiosa*, 2 S. iii. 123, 127, 128, 131, 135, 138.
— *Webbiana*, 2 S. ii. 240, 242, 263.
Abooke, Country Plum, v. 90, 451.
Abricot d'Alexandrie, 2 S. i. 72.
— d'Alexandrie, Gros, 2 S. i. 60.
— Amande Aveline, 2 S. i. 69.
— Amandier, 2 S. i. 65.
— Angoumois, 2 S. i. 71.
— Blanc, 2 S. i. 59.
— Commun, 2 S. i. 61.
— Commun à Feuilles Panachées de Jaune, 2 S. i. 62.
— Gros précoce, 2 S. i. 60.
— Hâtif Musqué, 2 S. i. 58.
— de Hollande, 2 S. i. 69.
— de Nancy, ii. 201; 2 S. i. 66, 70, 73.
— de Nüremberg, 2 S. i. 66.
— Pêche, i. App. 8; ii. 201; 2 S. i. 59, 66.
— de Piémont, 2 S. i. 66.
— Précoce, 2 S. i. 58.
— Royal, 2 S. i. 63.

Abricot de St. Jean, 2 S. i. 60.
— de St. Jean Rouge, 2 S. i. 60.
— de Tours, 2 S. i. 66.
— du Wirtemberg, 2 S. i. 66.
Abricotier à Feuilles Panachées, 2 S. i. 62.
Abricotin, 2 S. i. 58.
Acacia affinis, 2 S. ii. 242, 246.
— *armata*, vii. 41; 2 S. ii. 246, 247.
— *dealbata*, 2 S. ii. 242, 246, 247.
— *decurrens*, and others, 2 S. ii. 247.
— *diffusa*, 2 S. ii. 240, 242, 247.
— *Julibrissin*, vi. 38; 2 S. ii. 242.
— *lophantha*, 2 S. ii. 242, 247.
— *stricta*, 2 S. ii. 240, 246.
— *verticillata*, 2 S. ii. 242, 246, 247.
Acaste pulchra, i. 323.
— *venusta*, i. 322.
Acclimatizing, hints respecting, i. 21; vii. 31.
— effected not by suckers or cuttings, but by repeated sowing, i. 24.
Aceras Anthropophora, vi. 405.
Acer campestre, vi. 499.
— *variegatum*, vi. 496.
— *oblongum*, 2 S. ii. 264.
— *palmatum*, 2 S. ii. 257.
Achimenes longiflora, figured, 2 S. ii. 508; 2 S. iii. 140.
— *pedunculata*, 2 S. iii. 136.
— *picta*, figured, 2 S. iii. 161.
Achocõn, v. 104.
Achras Cainito, v. 105.
— *Lucuma*, v. 105.
— *mammosa*, 2 S. iii. 133.
— *Sapota*, v. 82, 96.
Αχρῖδες, or locusts of St. John, vi. 34.
Αχρον δέντρον, vi. 35.
Acocotli, medicinal virtues attributed to it, i. 84.

INDEX.

- Acocotli, Mexican name of one of the species of Dahlia, i. 84.
- ACON, Mr. JAMES, observations on the growth of early and late grapes under glass, vii. 1.
- Acorus calamus*, iv. 400.
- Acropera Loddigesii*, 2 S. iii. 116.
- Acrostichum calomelanos*, iii. 341.
- Actinocarpus minor*, i. 268.
- ADANSON, i. 331; vi. 277.
- Adansonia digitata*, v. 444.
- Adelia acidoton*, 2 S. ii. 257.
- Adiantum villosum*, iii. 341.
- Adina globiflora*, vi. 264.
- Administration of the Jardin du Roi, Paris; Plants received from, 2 S. ii. 411, 413, 414.
- Aëgle Marmelos*, v. 117.
- Aeranthus grandiflora*, vi. 282.
- Aerides*, treatment of, iv. 241.
- *odoratum*, i. 295; vii. 499.
- Aeridium odorum*, i. 295.
- African Custard Apple, v. 443.
- AFZELIUS, Professor ADAM, v. 89, 90, 440, 443, 446, 447, 449, 450, 451, 453, 457, 458, 460, 461, 462, 463, 464; vi. 86.
- Agapanthus umbellatus*, vi. 438, 439; vii. 40.
- Agaricus campestris*, ii. 403.
- *Georgii*, ii. 403.
- Agave americana*, account of one at Woodville, i. 242.
- notice relative to its flowering, iv. 389.
- *saponaria*, 2 S. iii. 117.
- Age, its influence upon trees greater in cold than in warm climates, i. App. 8.
- effects of, upon fruit trees, v. 384.
- AGLIONBY, H. A., Esq., 2 S. iii. 91.
- Aγνος*, vi. 46.
- Agriculture, Chinese, v. 49.
- Agrumi, iii. App. 2.
- Aguacate, 2 S. iii. 130.
- Aguas calientes, vegetation of, 2 S. iii. 119.
- Ailanthus glandulosa*, vi. 494.
- AINGER, Mr., 2 S. ii. 424, 435.
- AINSLIE, Sir WHITELAW, 2 S. ii. 172, 173.
- Air, method of admitting a due proportion into hothouses, i. 151.
- Air Plant, cultivation of, vii. 499.
- AITON, JOHN, Esq., vi. 213, 336.
- account of the Esperione Grape, iii. 93.
- information from, respecting the cultivation of the purple-fruited passion-flower, iii. 103.
- on forcing plums, iv. 531.
- AITON, W. T., Esq., i. Pref.; i. 254, 262, 276, 281, 287, 329; ii. 163, 164; iii. 86; vi. 65; vii. 24.
- AITON, W. T., Esq., his success in bringing the mango, &c., to perfection, i. 151.
- large crops of figs raised by him in the Royal Gardens at Kew, i. 254.
- brief practical observations on the cultivation of the cucumber in the Royal Gardens at Kew during the autumn and winter months, ii. 282.
- notice of a late nectarine raised in the Royal Gardens at Kew, iv. 211.
- Ajax, species named, i. 343 to 349.
- Akee tree, v. 90.
- Alamotou, v. 93.
- Alangium decapetalum*, v. 120.
- Albergier de Montgamet, 2 S. i. 65.
- Ordinaire, 2 S. i. 74.
- de Portugal, 2 S. i. 74.
- de Tours, 2 S. i. 74.
- Albuca major*, 2 S. ii. 269.
- *minor*, 2 S. ii. 269.
- Alburnous fibre, 2 S. ii. 117.
- Alburnum, its growth, and office in the process of vegetation, i. 219.
- of creeping plants, 2 S. ii. 36.
- Alchemilla nivalis*, 2 S. iii. 157.
- ALI KHAN, 2 S. ii. 173.
- Alkalies required by plants, 2 S. iii. 189.
- Alkaline Salts, 2 S. iii. 56.
- Aletris farinosa*, i. 328.
- Alexandrian Laurel, vi. 48.
- ALEXANDER, D., Esq. 2 S. i. 332.
- ALEXANDER, Dr. WILLIAM, i. 328.
- Alexis bifurca* and *grandiflora*, their introduction, i. 284.
- Algarobia dulcis*, 2 S. iii. 132.
- ALLEN, Mr. JOHN, vi. 477.
- ALLEN, Mr. THOMAS, on forcing cucumbers, vi. 127.
- Alligator apple, v. 95.
- pear (*Laurus Persea*), v. 96; 2 S. iii. 130.
- effects of temperature on, iii. 463.
- Alimentary plants, attention directed to their improvement, 2 S. ii. 348.
- Allium, notices respecting some varieties of the genus, iii. 416.
- *Ampeloprasum*, iii. 418.
- *Cowani*, vi. 98.
- *fistulosum*, iii. 377, 417.
- *striatellum*, vi. 97.
- *striatum*, vi. 97.
- ALLNUTT, JOHN, Esq., 2 S. i. 534, 535.
- Allobé, v. 88.
- Almonds, both sweet and bitter, known to the Romans, i. 152.

INDEX.

- Almonds, recommended for stocks for peaches and nectarines, ii. 90.
- Almond tree, early blossoming of, in 1834, 2 S. ii. 3.
- account of a peach tree raised from the seed of one, iii. 1.
- Almond-stock proper for budding peaches upon, i. App. 5.
- Almond Amère, iv. 410.
- Commune, iv. 409.
- Douce à coque dure, iv. 409.
- Douce à coque tendre, iv. 409.
- des Dames, iv. 409.
- Pistache, iv. 409.
- Princesse, iv. 409.
- Sultana, iv. 409.
- Almyra stellaris, i. 336.
- Alnus ferruginea, 2 S. iii. 160.
- mexicana, 2 S. iii. 126, 138.
- Aloe, American, account of one at Salcombe, which flowered in the open ground, i. 176.
- Alonsoa urticifolia, vii. 42.
- Aloysia citriodora, vii. 40; 2 S. ii. 242, 281.
- Alpine plants, how raised in the Jardin des Plantes, Paris, i. App. 24.
- Alpinia Galanga, i. 281.
- jamaicensis, i. 281.
- mutica, i. 280.
- nutans, i. 279.
- occidentalis, i. 282.
- racemosa, i. 281.
- spicata, vi. 274.
- spiralis, i. 279.
- Alps, the Swiss, aspect of their vegetation and description of some of the native trees, i. App. 17.
- Alstonia ciliata, 2 S. iii. 124.
- venenata, vii. 54.
- Alströemeria aurea, 2 S. ii. 242, 280, 281.
- edulis, i. 332.
- Flos Martini, vi. 82.
- hirtella, 2 S. ii. 280.
- ovata, 2 S. ii. 280.
- Pelegrina, 2 S. ii. 280; vii. 40.
- psittacina, 2 S. ii. 280.
- pulchella, 2 S. ii. 242, 280.
- Alströemerias, on their cultivation, 2 S. ii. 124.
- Althæa nudiflora, vii. 251.
- Alum, 2 S. iii. 37, 38.
- Alumina, 2 S. iii. 36.
- Alum-water applied to hydrangea plants, to render their flowers blue, iv. 568.
- Alyssum sativum, v. 35.
- Amandes, iv. 409; see Almonds.
- Amaranthus caudatus, vi. 55.
- hybridus, vi. 55.
- Amaranthus polygamus, v. 54.
- tristis, v. 54.
- Amaryllis, description of the pollen of, iv. 34.
- remarkable case of præternatural formation in the flowers of one, vi. 313; figured, vi. 315.
- notice of certain seedling varieties of, v. 337.
- on a hybrid one, v. 390.
- advena, vi. 88, 89.
- aurea, i. 299.
- Belladonna, 2 S. ii. 268.
- candida, vi. 89.
- crocata, iv. 39; vi. 309; 2 S. ii. 268.
- cyrtanthoides, vi. 88.
- equestris, v. 338, 339.
- equestri-vittata, v. 337.
- Forbesii, vi. 87, 88.
- β , purpurea, vi. 285.
- formosissima, 2 S. ii. 268.
- fulgida, v. 337, 338.
- Johnsoni, iv. 499, 501; v. 340, 390.
- laticoma, iv. 184.
- longifolia, vi. 98; instructions for its treatment, iii. 187, 192.
- fl. albo, vi. 292.
- var. longiflora, iv. 50.
- ornata, iii. 189.
- β , iv. 38.
- psittacina, 2 S. ii. 268.
- psittacinâ-Johnsoni, v. 361.
- Reginae, iv. 49; v. 339.
- Reginae vittata, iv. 40, 498.
- Reginae-vittata, hybrid, figured, v. 340.
- hybrid, v. 390.
- seedlings from, iv. 42.
- rutila, v. 337, 338, 339.
- sarniensis, iii. 399, 447.
- on its cultivation, vi. 259.
- vittata, iv. 44, 49; 2 S. ii. 268.
- zeylanica, iii. 190.
- American Blight, vi. 547.
- AMHERST, Lord, vi. 486.
- Amica nocturna, i. 43.
- Ammobium alatum, vi. 95.
- Ammonia, 2 S. iii. 98.
- muriate of, suggestion as to its being employed for the destruction of insects, iv. 78.
- Ammonia, salts of, experiments with, in the growth of plants, 2 S. iii. 57.
- Ammoniacal water, 2 S. iii. 46.
- Amomum angustifolium, i. 283.
- Cardamomum, i. 282.
- grandiflorum, i. 284.
- Grana Paradisi, i. 283.

INDEX.

- Amomum Plinii*, i. 176.
 ——— *xanthorhiza*, i. 284.
 ——— *Zerumbet*, i. 285.
Amphiglottis lurida and *secunda*, i. 294.
Amorpha fruticosa, vi. 495.
Amygdalus orientalis, 2 S. ii. 271.
 ——— *pumila*, 2 S. ii. 252.
Anagallis, iv. 23.
Anagyris foetida, vi. 499.
 ——— *indica*, vi. 499; vii. 245; 2 S. ii. 264.
 Analysis of the soil of the Society's garden,
 2 S. iii. 36.
Ananas Antigua aurantiaca, 2 S. i. 9.
 ——— *rubra*, 2 S. i. 16.
 ——— *Jamaica purpurea*, 2 S. i. 32.
 ——— *malabarica*, 2 S. i. 9.
 ——— *ordinaire*, 2 S. i. 29.
 ——— *ovale*, 2 S. i. 29.
 ——— *providentia*, 2 S. i. 10.
 ——— *sans épines*, 2 S. i. 9.
 ——— *semiserrata*, 2 S. i. 8.
 ——— *viridis inermis*, 2 S. i. 7.
Ananassa bracteata, 2 S. i. 6.
 ——— *debilis*, 2 S. i. 4, 6.
 ——— *lucida*, 2 S. i. 4.
 ——— *sativa*, 2 S. i. 4.
 Anchovy pear, v. 98.
Anchusa italica, vii. 40.
 ANDERSON, DAVID, Esq., vii. 199.
 ANDERSON, Mr. DAVID, v. 69; notice of a
 plum exhibited by him, iv. 207.
 ——— account of the Mon-
 tagu Cantaloup melon, with a description of
 the method by which it was obtained, iv. 318.
 ANDERSON, GEORGE, Esq., i. 354, 476; ii. 280,
 347; iii. 358; iv. 290, 292, 294; vi. 467,
 470, 472; vii. 419, 470, 475, 476, 481,
 493, 497; imported the *Tulipa Clusiana*,
 i. 334.
 ——— account of a method
 of forcing vines and nectarines, ii. 245.
 ——— tribute to his memory,
 ii. 280.
 ——— account of a method
 of ripening grapes by dung-heat, drawn up
 by him, ii. 330.
 ANDERSON, Mr. JOHN, account of the New
 Zealand spinach (*Tetragonia expansa*), iv.
 488; noticed, vi. 577.
 ——— account of his method
 of growing early celery, v. 492.
 ANDERSON, Mr. WILLIAM, i. 135; on the in-
 troduction and cultivation of a variety of
Azalea indica, ii. 259.
 ANDROSSI, vi. 40.
 ANDREWS, iii. 101, 224; iv. 288, 290, 299;
 vi. 469, 471; 2 S. i. 544.
- Andromachia acaulis*, 2 S. iii. 154.
 ——— *igniaria*, 2 S. iii. 154.
 ——— *solidaginea*, 2 S. iii. 155.
Andromeda, 2 S. i. 465.
 ——— *arborea*, 2 S. ii. 260.
 ——— *floribunda*, 2 S. ii. 260.
 ——— *polifolia*, 2 S. ii. 260.
Aneilema Sinicum, vi. 79.
Anemone, cultivation of, iv. 374.
 ——— *vitifolia*, 2 S. ii. 264.
 ANGERSTEIN, JOHN JULIUS, Esq., iv. 89.
 Angolam, v. 120.
 ANGUILLARA, iii. 343.
Anigozanthus flavida, i. 327.
 ——— *grandiflora*, i. 327.
Angræcum luridum, vi. 86.
Anigosia flavida, whence brought, i. 327.
 Animals, domestic, Societies for the improve-
 ment of, established throughout the British
 empire, i. 2.
 ——— carnivorous and herbivorous, their
 expulsion from the habitations of man not
 easily accomplished, i. 41; their power
 in warm and thinly inhabited countries, i.
 42.
Anisophylleia laurina, v. 446.
Anneslea spinosa, iii. 32.
 Annual plants, methods of applying manure to
 them, i. 6.
 ——— an improved method of raising
 them, 2 S. i. 75.
 ——— beneficial effects of the accumu-
 lation of sap in, 2 S. i. 323.
 Anomalies, fructiferous, instances of, i. 103;
 accounted for, i. 106.
Anomatheca cruenta, 2 S. ii. 269.
 ——— *juncea*, i. 323.
Anomaza excisa, i. 323.
Anona Cherimolia, v. 102.
 ——— *glabra*, 2 S. ii. 259.
 ——— *longifolia*, v. 101.
 ——— *muricata*, v. 95.
 ——— *palustris*, v. 95.
 ——— *punctata*, v. 101.
 ——— *reticulata*, v. 94.
 ——— *senegalensis*, v. 92, 443.
 ——— *squamosa*, v. 94, 402.
 ——— *tripetala*, v. 102.
 ANSTICE, Mr. GEORGE, notice of a plan by, for
 heating stoves, iii. 121.
 ANSON, Viscount, vi. 440; 2 S. i. 67.
Anthemis artemisiaefolia, iv. 327.
Anthemis grandiflora, iv. 326, 328.
 ——— *stipulacea*, iv. 327.
Anthericum bicolorum, i. App. 21.
 ——— *serotinum*, i. 328.
Anthocercis viscosa, 2 S. ii. 247.

INDEX.

- Antholyza æthiopica*, i. 324.
 ——— *æthiopica*, β , i. 324.
 ——— *floribunda*, i. 324.
 ——— *fulgens*, i. 323.
 ——— *ringens*, i. 324.
 ——— *vittigera*, i. 324.
Antidesma, v. 447, 463.
 ANTOINE, Mr. J., fruit trees received from, 2 S. ii. 414.
 ANTROBUS, Sir EDWARD, 2 S. i. 540, 541, 542, 543.
Αρωτος δεινδρον of Diosc., vi. 35.
 APARTADO, Marquess d', ii. 156.

INDEX.

Fruit-trees, on the proper management of those intended for early forcing, ii. 368.
 — description of a mode of training, by M. Noisette, ii. App. 8; figured, *ib.*
 — treatment of, by Mr. Charles Harrison, iii. 37.
 — to counteract the effects of frost, iii. 42.
 — on the causes of decay in, iii. 291.
 — effects of the application of a ligature on, iv. 123.
 — observations on a method of training them in Russia to preserve them from frost during winter, iv. 405.
 — mode of grafting to induce their early fruiting, iv. 410.
 — destruction of insects on, v. 76.
 — blight, v. 175.
 — gumming of, v. 175.
 — mildew, v. 175.
 — wash for, v. 319.
 — effects of age on, v. 384.
 — upon the beneficial effects of protecting their stems from frost in early spring, vi. 228.
 — composition for the destruction of insects on, vi. 541.
 — protecting frame for, vii. 76.
 — on the alluvial banks of rivers, vii. 135.
 — planting of, on raised banks, vii. 139.
 — to furnish naked branches of with new wood, vii. 417.
 — against walls, upon the causes of the premature death of parts of their branches, 2 S. ii. 34.
 — pruning of, 2 S. ii. 511.
 FRY, PETER, Esq., 2 S. i. 540.
 — Dr., iv. 525.
 Fuchsias, upon their cultivation, vi. 520.
 Fuchsia ampliata, 2 S. iii. 154.
 — arborescens, 2 S. iii. 126.
 — canescens, 2 S. iii. 158.
 — coccinea, inured to the climate of Devonshire, i. 175.
 — cordifolia, 2 S. iii. 135.
 — corollata, 2 S. iii. 158.
 — dependens, 2 S. iii. 155.
 — discolor, 2 S. ii. 284.
 — excorticata, 2 S. ii. 256.
 — fulgens, 2 S. iii. 122.
 — gracilis, 2 S. ii. 243, 284.
 — hirtella, 2 S. iii. 160.
 — longiflora, 2 S. iii. 155.
 — loxensis, 2 S. iii. 149.
 — petiolaris, 2 S. iii. 159.
 — scabriuscula, 2 S. iii. 155.

Fuchsia sessiliflora, 2 S. iii. 155.
 — splendens, 2 S. iii. 131.
 — sylvatica, 2 S. iii. 155.
 — verrucosa, 2 S. iii. 160.
 — virgata, 2 S. ii. 243, 284.
 Fuel, on the most economical method of employing it in heating flues, iv. 156.
 Fumigator, vi. 140; figured, vi. 141.
 Fungi, copper contained in, 2 S. iii. 53.
 FURRELL, Mr. JOHN, iv. 455.
 Furze, 2 S. ii. 225, 226, 235, 245.
 — Irish, 2 S. ii. 235, 245.

G.

GÆRTNER, iv. 489; vi. 70.
 GAGE, Sir THOMAS, i. 328.
 GAINES, Mr., 2 S. i. 540, 544, 546.
 Galanga officinalis, i. 281.
 Galatea vespertina, i. 310.
 Galaxia grandiflora, i. 314, 315.
 — graminea, i. 315.
 — mucronularis, i. 315.
 — obtusa, i. 315.
 — ovata, i. 315.
 — α , i. 314.
 — versicolor, i. 315.

- account of experiments on the production of blue instead of red flowers on the *Hydrangea hortensis*,

INDEX.

with some notes on the propagation and management of the plants, iii. 173.

Hedgehogs, Crocine, i. 130.

Hedychium, on the cultivation of its species and varieties in a stove, vi. 449.

———— acuminatum, vi. 450.

———— angustifolium, vi. 450.

———— aurantiacum, vi. 450.

———— carneum, vi. 451.

———— coccineum, vi. 451.

———— coronarium, vi. 451.

———— elatum, vi. 451.

———— ellipticum, vi. 451.

———— flavescens, vi. 451.

———— flavum, vi. 451.

———— Gardnerianum, vi. 451.

———— glaucum, vi. 451.

———— longifolium, vi. 451.

———— maximum, vi. 451.

———— spicatum, vi. 451.

———— thyrsoiflorum, vi. 451.

———— villosum, vi. 451.

Heliconia Bihai, i. 273.

———— psittacorum, i. 272.

Heliotrope, Peruvian, vii. 26.

Heliotropium peruvianum, vii. 40.

Helix hortensis, ii. 151.

Helixyra flava, i. 305.

Hellenia abnormis, vii. 60.

———— Allughas, i. 281.

Hemerocallis alba, i. 335.

———— cærulea, i. 335.

———— graminea, i. 334, 335.

———— japonica, i. 335.

———— valentina, i. 341.

Hemionitis dealbata, iii. 339, 341.

———— rufa, iii. 341.

Hemp, plants of, prevent the butterfly from infesting cabbage-plants, iv. 569.

HEMPEL, Rev. GEORGE CHARLES LEWIS, ii. 263, 265, 269, 382.

———— translation of his tract on improving fruit trees, ii. App. 1.

———— his account of the effects of ringing the bark, iv. 557.

HENDERSON, Dr., 2 S. i. 534, 535; 2 S. iii. 35.

———— Mr. ANDREW, vi. 171.

———— Mr. JOHN ANDREW, 2 S. i. 530, 534, 540.

———— Mr., gardener to C. Foster, 2 S. i. 546.

———— Mr. WALTER, account of a mode of managing peach trees, in an early peach-house, vii. 209.

HENDERSON, Mr., Zacatecas, 2 S. ii. 391.

HENON, M., 2 S. iii. 29.

HENRY IV., daffodils cultivated at Paris in his time, i. 349.

HENSLOW, Rev. Professor, 2 S. ii. 227, 231, 277.

HERBERT, Mr. JOHN, vi. 309.

———— Hon. and Rev. WILLIAM, iii. 141, 254; iv. 260, 367, 369, 422, 423, 500, 502; v. 293, 337, 338, 391; vi. 87, 89; vii. 75; 2 S. i. 530; 2 S. ii. 32, 33, 227, 236, 258, 266, 268, 281, 289, 461.

———— information collected by him respecting the original Ribston Pippin tree, iii. 141.

———— instructions for the treatment of the *Amaryllis longifolia*, as a hardy aquatic, with some observations on the production of Hybrid plants, and the treatment of the bulbs of the genera *Crinum* and *Amaryllis*, iii. 187.

———— notice of the flues in his hot-houses, iii. 255.

———— on the production of Hybrid vegetables, with the results of many experiments made in the investigation of the subject, iv. 15.

———— on the culture of the African *Gladioli*, and other Cape bulbs, in the open borders, iv. 153.

———— on the culture of hyacinths, iv. 163.

———— on the culture of the Guernsey Lily, and other bulbs of the genera *Nerine*, *Coburgia*, and *Brunsvigia*, iv. 176.

———— on the treatment of the *Dendrobia*, *Aerides*, and other parasitical plants, iv. 241.

———— notice of certain seedling varieties of *Amaryllis* presented by him to the Society, v. 337.

Heritiera Gmelini, i. 327.

———— tinctorium, i. 327.

HERMANN, ii. 37.

Hermannia flammea, 2 S. ii. 271.

———— hirsuta, 2 S. ii. 271.

———— plicata, 2 S. ii. 271.

Herminium Monorchis, vi. 405.

Hermione ambigena, i. 361.

———— bifrons, i. 359.

———— crenularis, i. 363.

———— cupularis, i. 361, 362.

———— floribunda, i. 362.

———— jasminea, i. 360.

———— junciflora, i. 357.

———— lecuoifolia, i. 359.

INDEX.

- Hermione similis*, i. 358.
 ——— *stellaris*, i. 359.
 ——— *stylosa*, i. 360.
 ——— *tegulæflora*, i. 363.
Hermodactylus tuberosus, i. 304.
HERNANDEZ, i. 47, 343, 345; 2 S. i. 42; 2 S. ii. 396.
 ——— his evidence respecting the Tuberose, i. 48.
 ——— his account of some species of the Dahlia, i. 84, 85.
Hernandia sonora, vii. 391.
HERON, Sir ROBERT, vi. 161.
HERRIOT, THOMAS, his account of the Openawk plant, i. 9.
HERTFORD, Marquis of, iii. 118; v. 206.
HERVY, M., Director of the Luxembourg Garden at Paris, v. 125, 128; 2 S. i. 63, 289, 330.
 ——— account of pears received from, v. 126.
HESKETH, ROBERT, Esq., vi. 274, 279; vii. 65.
Hesperanthus tenuifolius, i. 321.
 ——— *radiatus*, γ , i. 321.
Hesperis matronalis, ii. 155.
 ——— produce of oil, v. 41.
HETHERINGTON, THOMAS WILSON, Esq., vii. 153.
HEWITT, Rev. AUGUSTUS, 2 S. ii. 234.
Hexaglottis longifolia, i. 313, 314.
HIBBERT, GEORGE, Esq., i. 262, 268, 288, 305, 311, 312, 315, 335; vi. 476, 477, 478.
 ——— account of some plants introduced by him, i. 267, 268, 288, 305, 335.
Hibiscus esculentus, vi. 53.
 ——— *militaris*, 2 S. ii. 302.
 ——— *Rosa sinensis*, 2 S. ii. 302, 304.
 ——— *syriacus*, vii. 41; 2 S. ii. 275.
HICK, CHARLES WILLIAM, Esq., apples exhibited by, iii. 312.
HILDYARD, Mr. ELIAS, description of a mode of destroying the onion grub, vii. 93.
HILL, DANIEL, Esq., his remarks on the utility of oxygen in promoting vegetation, i. 203.
 ——— Dr., account of his successful application of oxygen gas to an orange tree, iv. 134.
 ——— Lord, plants received from, 2 S. ii. 416.
Himia salicifolia, 2 S. ii. 284.
Hippophaë conferta, 2 S. ii. 265.
HIRD, Mrs., i. 299.
HIRSCHFELD, iv. 523.
HITT, 2 S. i. 59, 329.
 ——— his directions for training trees, i. 171.
HOA-OUANG, vi. 485.
HOBSON, Capt. GEORGE, iii. 120.
- HODGSON**, THOMAS, a garden labourer, pressed for a sailor, sent home wounded from the siege of Carthage, brought with him the *Hymenocallis littoralis*, i. 338.
HODSON, Mr., vii. 438.
Hoe, Chinese, v. 51.
HOFFMAN, MARTIN, Esq., vi. 410.
Hog-plums, v. 90, 450, 451.
Hog-plum of the West Indies, v. 99.
HOGAN, Mr. WILLIAM, v. 308.
 ——— on a method of cultivating the mushroom, v. 305.
HOGG, Mr., 2 S. i. 536, 542, 543.
 ——— Mr. THOMAS, ii. 361.
 ——— account of a method of growing early forced potatoes, ii. 144.
 ——— on the cultivation of pinks, iv. 451.
 ——— Mr. WALTER, his mode of treating large pine-apple plants, iv. 555.
HOLDEN, ROBERT, Esq., iii. 329; apples exhibited by, iii. 315.
 ——— description of a screen for protecting wall trees, iv. 93.
HOLFORD, CHARLES, Esq., vi. 570.
 ——— his mode of fastening trees to walls, iv. 569.
 ——— description of a pine-house and pits, v. 499; plans and sections of, v. 501.
HOLLAND, Right Hon. Lady, species of Dahlias introduced by her, i. 92, 97.
 ——— iii. 224.
 ——— LANCELOT, Esq., 2 S. ii. 231.
HOLLIST, HASLER, Esq., 2 S. ii. 160.
Holly, 2 S. ii. 226, 243, 261.
 ——— eligible for garden fences, ii. 355.
 ——— season for transplanting, ii. 357.
 ——— berries of the, not ripe till March or April, ii. 357.
 ——— time and manner of sowing, ii. 357.
Holly-hedges and trees in Scotland, account of some remarkable, vii. 194.
HOME, Sir EVERARD, vi. 59.
HOLMES, Mr. JOSEPH, observations made by him on the growth of plants at different periods of the day, 2 S. iii. 247.
 ——— Mr. WILLIAM, notice of a seedling peach raised by him, vi. 393.
HOMER, vi. 35.
Homeria collina, i. 307.
 ——— *ochroleuca*, i. 308.
Homoglossum præcox, i. 325.
Honey-dew, iii. 56.
Honey-gift, ii. 157.
Honeysuckles (Passiflora), iii. 102.
HOOD, Mr. C., 2 S. ii. 372.

INDEX.

- HOOKE, Mr. STEPHEN**, 2 S. i. 535, 541, 542, 546; 2 S. ii. 227, 233, 294.
- notice of specimens of a Peach sent by him to the Society, vi. 394.
- **WILLIAM**, Esq., i. 198, 285; ii. 62, 137, 143, 217, 279, 287, 400; iii. 5, 267, 304, 397; iv. 212, 316, 330, 523; v. 136, 536, 539, 548, 549; 2 S. i. 246.
- an account of some specimens of apples imported from Rouen, in Normandy, ii. 298.
- notice of a Plum exhibited by him, ii. 402.
- account and description of Wilmot's New Early Orleans Plum, iii. 392.
- description of a mode of cultivating Pine-Apples, iv. 363.
- account of Williams's Bon Chrétien, ii. 250.
- **Sir WILLIAM JACKSON**, iii. 339, 457; vi. 93, 94, 96, 262, 264, 269, 273, 279, 281, 283; vii. 245, 498; 2 S. ii. 376.
- Hop**, observations on its rate of growth at different periods of the day, 2 S. iii. 247.
- HOPE, Dr.**, i. 267, 361.
- HOPETOUN, Earl of**, vi. 111, 429; vii. 199.
- Hopetoun-House**, account of Holly Hedges at, vii. 199.
- HOPWOOD, Mr.**, 2 S. i. 536, 543.
- HORNEMANN**, v. 33; vi. 94.
- HORREX, Mrs.**, iv. 69.
- Horse-radish**, v. 42; 2 S. iii. 62.
- its cultivation, i. 207; v. 302.
- as practised in Denmark, 2 S. i. 91.
- Horticulture**, amidst national and domestic improvements, had been neglected, i. 2.
- susceptible of essential improvement, i. 7.
- appreciated by all ranks of men, i. 41.
- observations on the expediency of giving it a scientific form, ii. 290.
- Chinese, v. 49.
- Horticultural Society**, remarks on its objects, i. 1, 41, 122, 157, 230.
- Report on the Progress of the, 2 S. ii. 372.
- HOSACK, Dr.**, account of the Seckel Pear, iii. 256; iv. 520; vi. 162.
- Hot air**, chamber for, in a stove, ii. 387.
- Hot-beds**, few of them made in the most advantageous form, i. 5.
- remarks on the proper construction of their frames, i. 142.
- Hot-beds**, improved method of placing them on inclined planes of earth, i. 142.
- account of some improvements in their construction, vii. 281; figured, 282.
- Hot-houses**, observations on those of the Romans, i. 147.
- imperfectly constructed formerly, i. 149.
- little used in England at the beginning of the last century, i. 150.
- future probable mode of their construction, i. 151.
- angle of inclination of their roofs, diagrams of, i. 155.
- mode of heating, 2 S. i. 202; figured, 197.
- economical plan for heating, iii. 121.
- glazing of, iii. 244.
- Hot-house**, section of Mr. Knight's curvilinear, v. 233.
- Hot-houses**, self-regulating ventilator for, v. 502.
- advantages and disadvantages of curvilinear iron roofs to, v. 227.
- advantages of an external covering for, vi. 22.
- on the management of their flues so as to keep up a nearly equal temperature during the night, vi. 247.
- in the garden of the Society, vi. 373.
- Hot-wall**, plan of one exhibited, iv. 139.
- description of one, vii. 218; plan of, vii. 220.
- Hot water** employed as a means of heating by Anthony Bacon, Esq., in 1822, vii. 204.
- upon its application in heating hot-houses, vii. 568.
- apparatus, Mr. Cruikshank's, 2 S. i. 513; figured, 514.
- HOUBLON, JOHN ARCHER, Esq.**, ii. 229.
- Mr., introduced the Florence Cherry, ii. 229.
- House-leek**, vi. 313.
- HOUSTON, Dr.**, i. 276.
- HOWARD, Hon. FULKE GREVILLE**, iv. 560; v. 399; 2 S. i. 8, 21.
- Mr. LUKE, vii. 100, 129.
- HOWISON, Dr.**, iv. 226, 230.
- Hovenia acerba**, 2 S. ii. 265.
- dulcis, v. 125.
- Hoy, Mr.**, i. 327; vii. 17.
- Hoya**, on the species of, vii. 16.
- acuta, vii. 23.
- albens, vii. 23.
- carnosa, vii. 19.
- on a remarkable property of, ii. 197.

INDEX.

- Hoya carnos*, its property of attracting insects doubted, iv. 108.
- *cochin-chinensis*, vii. 28.
- *lanceolata*, vii. 23, 28.
- *linearis*, vii. 28.
- *nicobarica*, vii. 28.
- *pallida*, vii. 23.
- *parasitica*, vii. 23.
- *Pottsii*, figured, vii. 25.
- *trinervis*, vii. 26.
- *viridiflora*, vii. 27.
- HOYTE, Mr., vi. 414.
- HUDSON, Mr., i. 266.
- HÜGEL, Baron, 2 S. ii. 409.
- plants received from, 2 S. ii. 414.
- HUMBOLDT, Baron, iii. 220, 226, 351; v. 82, 100, 250; vii. 51; 2 S. i. 42, 460; 2 S. ii. 223, 286.
- citation from his Personal Narrative, respecting Fruits of the Torrid Zone, v. 82.
- HUME, Sir ABRAHAM, Bart., ii. 279, 330; ii. App. 4; iii. 195; iv. 333, 337, 338, 341, 343, 345, 346, 347, 421; vi. 325, 470, 472, 475; vii. 286.
- description of a Stove for tropical Plants in his Garden, ii., App. 4.
- account of a plant of the *Magnolia conspicua*, iv. 59.
- Chinese Chrysanthemums introduced by, iv. 333.
- Lady Amelia, iv. 422; vii. 539.
- Humidity in Hot-houses, vi. 382.
- with a change of air, beneficial effects of, vii. 414.
- Humus, Woolwich, 2 S. iii. 94, 96, 97, 99.
- Hunnáb agághi, vi. 37.
- HUNNEMAN, Mr., iii. 72.
- JOHN, roots of the Teltow Turnip sent by him, with an account of its cultivation, vi. 113.
- HUNT, Mr., iv. 125.
- , —, Esq., Stratford-on-Avon, v. 206.
- THOMAS, Esq., Apple sent by, iv. 525.
- result of his experiments in ringing the bark of Fruit-trees, iv. 564.
- Mr. THOMAS, vii. 263.
- HUNTER, Dr., i. 57.

INDEX.

KNIGHT, THOMAS ANDREW, Esq., on the advantages of employing vegetable matter in a fresh state, i. 248.

_____ on facilitating the emission of roots from layers, i. 255.

_____ on two new varieties of the grape, i. 258.

_____ his recommendation of charcoal to prevent plants from damping off, i. 311.

_____ account of the Elton Pear, ii. 1.

_____ on the transplantation of blossom-buds, ii. 7.

_____ on an early variety of grape, ii. 10.

_____ on the proper stock for the Moorpark Apricot, ii. 19.

_____ on inarching leafless branches of peach trees, ii. 35.

_____ on the disease called the Curl in the potato, ii. 64.

_____ on the culture of the mulberry, ii. 68.

_____ on the early puberty of the peach tree, ii. 70.

_____ on the prevention of mildew in particular cases, ii. 82.

_____ on the culture of the shallot, ii. 97.

_____ on the propagation of the mulberry tree by cuttings, ii. 114.

_____ on the beneficial results of planting potatoes which have been grown late in the preceding year, ii. 125.

_____ on the application of manure in a liquid form to plants in pots, ii. 127.

_____ on the ill effects of excessive heat in forcing-houses during the night, ii. 130.

_____ account of two varieties of cherry, ii. 137.

_____ account of the Acton Scot peach, ii. 140.

_____ on the want of permanence of character in varieties of fruit, when propagated by grafts and buds, ii. 160.

_____ on the mode of propagation of the *Lycoperdon cancellatum*, a species of fungus which destroys the leaves and branches of the pear tree, ii. 178.

KNIGHT, THOMAS ANDREW, Esq., on the preservation of fruits during the winter and spring, ii. 193.

_____ on the effects of different kinds of stocks in grafting, ii. 199.

_____ account of three varieties of cherries, ii. 208.

_____ account of three new varieties of peaches, ii. 215.

_____ on the culture of the peach and apricot on espalier trees, ii. 219.

_____ on the ventilation of forcing-houses, ii. 224.

_____ upon the advantages of propagating from the roots of old ungrafted fruit trees, ii. 252.

_____ on the means of preserving broccoli in winter, ii. 304.

_____ observations on Mr. Brown's steam apparatus, with suggestions for its improvement, ii. 324.

_____ observations on the Verdelho grape, ii. 327.

_____ suggestions for the improvement of Sir George Stuart Mackenzie's plan for forcing-houses (curvilinear), ii. 350.

_____ upon the proper mode of pruning the peach tree in cold and late situations, ii. 364.

_____ observations on the proper management of fruit trees intended for early forcing, ii. 368.

_____ notice of potatoes sent by him to the Society, for distribution, ii. 407.

_____ an account of a peach tree produced from the seed of the almond tree, with some observations on the origin of the peach tree, iii. 1.

_____ on the best mode of pruning and training the mulberry tree, when trained to a wall, in a cold climate, iii. 63.

_____ upon the variations of the red currant (*Ribes rubrum*) when propagated by seed, iii. 86.

_____ upon the propagation of varieties of the walnut tree by budding, iii. 133.

_____ on a method of forcing rhubarb in pots, iii. 154.

_____ upon the pruning and management of transplanted standard trees, iii. 157.

INDEX.

KNIGHT, THOMAS ANDREW, Esq., upon the preservation of fruits from wasps, iii. 256.

_____ upon the variations of the scarlet strawberry when propagated by seeds, iii. 207.

_____ description and account of a new early black cherry, iii. 211.

_____ description of a new seedling plum, iii. 214.

_____ on training the fig tree, iii. 307.

_____ on the superior healthfulness of scions taken from the trunks of apple trees, iii. 387.

_____ observations upon the most advantageous form of garden-pots, iii. 389.

_____ upon the culture of the Guernsey lily, iii. 399.

_____ upon the effects of very high temperature on some species of plants, iii. 459.

_____ upon the means of giving strength to the stems of plants growing under glass, iv. 1.

_____ upon the culture of the pine apple, without bark, or other hot-bed, iv. 72.

_____ on the most economical method of employing fuel in heating the flues of forcing-houses, iv. 156.

_____ physiological observations upon the effects of partial decortication, or ringing the stems or branches of fruit trees, iv. 156.

_____ further particulars of the Downton strawberry, iv. 197.

_____ upon the culture of the fig tree in a stove, iv. 200.

_____ notice of a peach raised by him, its parentage consisting of a peach and a nectarine, iv. 210.

_____ on the cultivation of the cocks-comb, iv. 321.

_____ observations on hybrids, iv. 367.

_____ directions for preserving buds of fruit trees in a vegetating state, when sent to considerable distances, iv. 403.

_____ upon pruning and training the plum tree, iv. 426.

_____ upon the managing of fruit trees in pots, iv. 439.

KNIGHT, THOMAS ANDREW, Esq., account of an improved method of raising early potatoes in the open ground, iv. 447.

_____ on grafting the vine, iv. 495.

_____ specimens of pears sent by, iv. 521.

_____ on the cultivation of the pine apple, iv. 543.

_____ observations on Mr. Turner's paper on the accidental intermixture of character in certain fruits, v. 67.

_____ observations on the cultivation of the pine apple, v. 142.

_____ notice of a new variety of *Ulmus suberosa*, and of a successful method of grafting slender scions of trees, v. 146.

_____ description of a melon and pine pit, v. 223.

_____ upon the advantages and disadvantages of curvilinear iron roofs to hot-houses, v. 227.

_____ on a new and improved method of cultivating the melon, v. 238.

_____ notice of a cherry raised by, v. 262.

_____ observations on the flat peach of China, v. 271.

_____ account of the injurious influence of the plum stock on the Moorpark apricot, v. 287.

_____ account of some mule plants, v. 292.

_____ account of an improved method of obtaining early crops of peas, after severe winters, v. 341.

_____ some remarks on the supposed influence of the pollen, in cross breeding, upon the colour of the seed-coats of plants and the quality of their fruits, v. 377.

_____ account of the Downton Imperatrice plum, v. 381.

_____ observations upon the effects of age upon fruit trees of different kinds; with an account of some new varieties of nectarines, v. 384.

_____ on the preparation of strawberry plants for early forcing, v. 432.

_____ on the protection of the blossoms of wall trees, v. 505.

_____ on the cultivation of strawberries, vi. 101.

INDEX.

- KNIGHT, THOMAS ANDREW, Esq., upon the beneficial effects of protecting the stems of fruit trees in early spring, vi. 228.
-
- _____ account of a method of obtaining very early crops of the grape and fig, vi. 233.
-

- oxide of iron, 2 S. iii. 36, 56.
- pearlash, 2 S. iii. 96.
- Manure, phosphate of ammonia, 2 S. iii. 58, 64, 66, 79, 80, 81, 83, 85, 86, 87, 89, 97, 192, 193, 194, 195, 203, 204, 205, 206.
- phosphate of lime, 2 S. iii. 70, 79, 80, 81, 82, 83, 85, 86, 194, 195.
- phosphate of soda, 2 S. iii. 37, 38, 39, 89, 191, 192.
- phosphoric acid, 2 S. iii. 36, 47, 50, 51.
- Poittevin's, 2 S. iii. 97, 99.
- potash, 2 S. iii. 36.
- rotten dung, 2 S. iii. 41, 48, 50, 51, 191, 192.
- sal ammoniac, 2 S. iii. 43, 48, 50, 51.
- salts of ammonia, 2 S. iii. 57.
- salt, common, 2 S. iii. 67, 68, 79, 80, 81, 83, 85, 86, 87, 89, 191, 192, 193, 194, 195, 203, 204, 205, 206.
- salt cake, 2 S. iii. 41, 42, 43, 48, 50, 51, 52.
- silicate of potash, 2 S. iii. 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 79, 80, 81.
- soda, 2 S. iii. 36.
- soot, 2 S. iii. 94, 99.
- sulphate of ammonia, 2 S. iii. 58, 69, 74, 79, 80, 81, 84, 85, 86, 89, 97, 191, 192, 193, 194, 195.
- copper, 2 S. iii. 95.
- iron, 2 S. iii. 37, 38, 43, 44, 46, 48, 50, 51, 94, 95, 99.
- lime, 2 S. iii. 73, 78, 79, 80, 81, 82, 84, 85, 86, 193, 194, 195.
- magnesia, 2 S. iii. 37, 38, 42, 75, 79, 80, 81, 84, 85, 86, 88, 89, 191, 192, 193, 194, 195, 203, 204, 205, 206.
- potash, 2 S. iii. 75, 76, 78, 79, 80, 81, 82, 84, 85, 86, 87, 89, 191, 192, 193, 194, 195.
- soda, 2 S. iii. 41, 42, 66, 67, 79, 82, 83, 85, 86, 88, 89, 94, 97, 99, 191, 192, 193, 194, 195.
- sulphur, 2 S. iii. 37, 38, 46, 48, 50, 51.
- sulphuret of potash, 2 S. iii. 96.
- sulphuric acid, 2 S. iii. 36, 45, 46, 47, 48, 50, 51, 95, 99, 100.
- superphosphate of lime, 2 S. iii. 88, 89, 91, 191, 192.
- urine, putrid, 2 S. iii. 44, 48, 50, 51.
- wood ashes, 2 S. iii. 96.
- water, applied to a plant of heath, vii. 183.
- MANVERS, Earl, 2 S. ii. 520.
- Maracoc, iii. 108, 109.
- Maracot, iii. 108, 111.
- Maracujas, iii. 112.
- Maranta arundinacea, i. 275.

INDEX.

- Maranta Galanga**, i. 281.

 tem, ii. 290.

INDEX.

- NOEHDEN, Dr., on ringing fruit trees, translated from the German, ii. App. 1.
 — on a mode of training fruit trees, described by M. Noisette, ii. App. 8.
 — on a successful mode of treating fruit trees, practised by Mr. Charles Harrison, iii. 37.
 — on some modes of continuing a supply of young potatoes through the year, iii. 48.
 — account of the original tree of the Ribston Pippin, laid before the Society by him, iii. 140.
 — account of the different varieties of the genus *Citrus* cultivated in Italy, according to Dr. Sickler's statement, iii. App. 1.
 — his review of the second edition of Hempel's 'Magic Ring of Pomona,' iv. 557.
- NORFOLK, Duke of, vii. 265; 2 S. i. 541; 2 S. ii. 227, 233.
- Nohud, vi. 54.
- NOISETTE, M., ii. 385, App. 8, 9; v. 131, 407, 537, 544; vi. 357; vii. 165; 2 S. i. 63, 71, 73, 230, 279, 292, 331.
 — mode of training fruit trees described by him, ii. App. 8.
 — apples sent by him, iii. 317.
 — notice respecting stocks for apple trees, iv. 411.
- Nolana paradoxa, vi. 296.
 — tenella, vii. 252.
- NORONHA, a Spanish botanist, ii. 156.
- NORTH, Mr., vii. 265.
 — Hon. Mrs., i. 308.
- North Devon Horticultural Society, 2 S. ii. 445.
- NORTHUMBERLAND, Duke of, vii. 17; 2 S. i. 67, 540.
- NUGENT, Mr., 2 S. ii. 220.
- Nuphar advena, iii. 31.
 — Kalmiana, iii. 31.
 — lutea, iii. 30, 31.
 — minima, iii. 30, 31.
- Nuts, method of keeping, ii. 399.
 — description of a mode of preserving them, vi. 546.
 — Common or Hazel, well known to the Romans, i. 153.
 — Cosford, ii. 402.
 — Frizzled Filbert, v. 263.
 — Hazel, ii. 185.
- NUTTALL, iv. 445; vi. 290, 294, 460; 2 S. ii. 125, 239.
- Nuttallia digitata, vi. 405.
 — pedata, vi. 405.
- Nymphæa alba, iii. 27; vi. 537.
- Nymphæa cærulea, iii. 29, 34, 35; vii. 286.
 — Kalmiana, iii. 31.
 — Lotus, iii. 28, 34.
 — lutea, vi. 537.
 — nitida, iii. 27, 33.
 — odorata, iii. 27; vi. 537; vii. 286.
 — var. minor, iii. 27.
 — pubescens, iii. 28, 34.
 — pygmæa, iii. 28, 30.
 — rubra, iii. 29, 34.
 — upon its treatment, vii. 285.
 — var. rosea, iii. 29, 34.
 — versicolor, iii. 29, 34.
 — stellata, iii. 30, 34, 35.
- O.
- Oak, i. App. 17; 2 S. ii. 226, 239, 244, 262, 279.
 — on the quality of its timber produced in Great Britain, 2 S. i. 336.
 — timber from old buildings, 2 S. i. 337.
 — wood, analysis of, 2 S. iii. 55.
 — Durmast, 2 S. i. 336.
 — Turkey, 2 S. i. 337.
- Oats, experiments with, in steeping the seeds, 2 S. iii. 205.
- Oaxaca, plants collected by Mr. Hartweg in the state of, 2 S. iii. 133.
 — vegetation of, 2 S. iii. 126.
- Ocote chino, 2 S. iii. 122.
- Ocymum febrifugum, vi. 83.
- Odontoglossum crispum, 2 S. iii. 160.
 — grande, 2 S. iii. 136, 145.
 — nebulosum, 2 S. iii. 127.
 — pardinum, 2 S. iii. 151.
 — pygmæum, 2 S. iii. 135.
 — Rossii, 2 S. iii. 136.
- Oedera prolifera, 2 S. ii. 271.
- Oenothera acaulis, vi. 98.
 — biennis, vi. 579.
 — hybrid, iv. 45.
 — purpurea, vi. 94.
 — Romanzovii, vi. 94.
 — sinuata, 2 S. iii. 154.
 — speciosa, vi. 293.
 — tenella, vi. 94.
 — triloba, vi. 293.
 — yellow-rooted, vi. 580.
- Ogheghe, v. 91.
- Ognon Blanc de Florence, iii. 376.
 — Gros, iii. 371.
